Ų	Optimization
---	--------------

Problem 1 – Optimization of distance and area

Graph the line y = 4x + 7. Find the point on the line that is closest to the origin.

- What point do you think minimizes the distance from the point to the origin?
- What function are you trying to minimize?

Name __ Class

- What is the constraint?
- Write the function to minimize using one variable.

On the Home screen, find the exact coordinates that minimize the distance using the **Derivative** and **Solve** commands. To do this, find the first derivative, solve to find the critical value(s), and then find the second derivative to confirm a minimum.

- What are the x- and y-coordinates of the point?
- What is the minimum distance?

Find the dimensions of a rectangle with perimeter 200 meters whose area is as large as possible.

- What dimensions do you think maximize the area?
- What function are you trying to maximize?

- What is the constraint?
- Write the function to maximize using one variable.

Find the dimensions that maximize the area using the **Derivative** and **Solve** commands.

• What are the dimensions of the rectangle?

Problem 2 – Optimization of time derivative problems

A boat leaves a dock at 1 pm and travels north at a speed of 20 km/h. Another boat has been heading west at 15 km/h. It reaches the same dock at 2 pm. At what time were the boats closest together? Use *t* for time.

• What is the position function for the boat heading north? West?

MAIN	DEGAUTO	FUNC	

- What function are you trying to minimize?
- What is the constraint?
- Write the function to minimize using one variable.

Find the time at which the distance between the two boats is minimized using the **Derivative** and **Solve** commands.

- What is the minimum distance?
- What is the time at which this occurs? Remember to convert the value of t to minutes.

Extension – Parametric function

A projectile is fired with the following parametric functions:

 $x = 500\cos(30^\circ)t$, $y = 500\sin(30^\circ)t - 4.9t^2$

- What is the time when the projectile hits the ground?
- How far does it travel horizontally?

• What is the maximum height that it achieves?
