## Transformations 3

Reflections \& гnoijogliэя

Student

## Introduction

The Transformations activities in this series involve using multiple functionalities of TI-Nspire to explore the concept of transformations of the plane - translations, dilations, reflections and combinations of these - and their effect on functions. The aim of this approach is to develop a sound understanding by linking graphical and algebraic representations of transformation problems and their solution and making sense of the algebra through visualisation of the relationship between the graph of the original function and the graph of the transformed function.
This is the third transformation activity in the series, and it focuses on reflections and on combinations of transformations.

## Exploration 3a. Reflection in the $y$-axis

a. In this part of the activity, you will explore the image of the line $x-2 y=5$ under the transformations:

- reflection in the $y$-axis

Please refer to the TI-Nspire document 'Transformation3' Open the TI-Nspire document 'Transformation3' and select page 2.1. On page 2.1, $P$ is a point on the graph of the functional relation with equation $x-2 y=5$.
The equation of the graph has been entered as a relation, rel1 $(x, y)$ (i.e. 'Relation 1').
The coordinates of the points shown have been stored as the variables, $P(x o, y o)$ and $P^{\prime}(x i, y i)$.

Technology Tip!
An easy way to enter (or edit) the equation of a graph as a relation:
menu > Graph Entry/Edit > Relation.
Making $P^{\prime}$ the image of $P$ under the transformation For $P^{\prime}$ to be the image of $P$, it needs to be reflected in the $y$-axis, therefore $x i$ assigned the value $-x o$ and $y i$ assigned the value $y o$ (e.g. $P(-5,-5) \rightarrow P^{\prime}(5,-5)$ because the sign of the $x$ coordinates are reversed, but the $y$-coordinates are unchanged by the reflection in the $y$-axis.

What to do - select page 2.2. This page is a Notes application with two Maths Boxes. Click (圈) the Maths Box so that a red dotted border appears, then input

* In the top box: $x i:=-x o$ and press enter.
*In the bottom box: $y i:=y o$ and press enter.
The coordinates of $P^{\prime}$ are now ( $-x o, y o$ ). When point $P$ is moved along the graph on page 2.1, $P^{\prime}$ will remain the image of $P$ under the transformation.

## Graph and equation of the transformed function

$P$ can be animated using the control buttons $1 \backslash$ Alternatively, $P$ can be grabbed ( $\mathrm{ctrl\mid}+$ 圈) and dragged along the graph. Press esc to release the 'grabbed' $P$.
Question 1
On page 2.1, use the control buttons to move point $P$, and observe the motion of point $P^{\prime}$. Describe the relationship between the positions of $P$ and $P^{\prime}$ as the points move.

## Path of $P^{\prime}$

Return $P$ to the original position by clicking the left control button $\mathbf{1 4}$. The 'Geometry Trace' tool will be used to obtain an outline of the path of $P^{\prime}$.
What to do. To activate this tool, move the cursor to the point $P^{\prime}$ and open the context menu by pressing atril +menu. Select 'Geometry Trace', then animate $P$. A trace of $P^{\prime}$ will be visible. When $P^{\prime}$ is outside the window settings, return $P^{\prime}$ to the starting position, then exit the tool by pressing esct.

| 421 Recent | $\wedge$ Rad $\square \times$ |

| 8 Measurement |  |
| 9 Geometry Trace |  |
| A Pin |  |
| B Colour |  |
| C Conditione | $\checkmark$ |

## Question 2

Describe qualitatively some of the key features of the trace of $P^{\prime}$. How do these key features relate to the graph of the original function?
Question 3
a. Use the trace of $P^{\prime}$ to determine the equation of the transformed function.
b. Test whether your equation in part b. is correct by graphing your equation on page 2.1, using the same set of axes as the graph of the original function. You should enter your equation as 'Relation 2' (menu > Graph Entry/Edit > Relation will ensure 'Relation' is selected. (The graph of your equation should contain all points traced by $P^{\prime}$ ).
c. Find (i) the gradient and (ii) the coordinates of the axes intercepts of the graph of the transformed function.
Relationship between equation of the transformed and original functions
Now consider how the equation of the transformed function could have been obtained from the equation of the original function, $x-2 y=5$.
Question 4
Which one of the following is the correct equation for the transformed function? Test your answer by entering the equation as 'Relation 2 ' on page 2.1. The graph should contain all points on the trace of $P^{\prime}$.
A. $-x-2 y=5$
B. $-x+2 y=5$
C. $x+2 y=5$
D. $x-2 y=5$

Explaining the equation of the transformed function
We saw that the point $P(x, y)$ maps to point $P^{\prime}(-x, y)$ under this transformation. That is, if $P^{\prime}$ has coordinates $\left(x^{\prime}, y^{\prime}\right)$, then

$$
\begin{aligned}
& x^{\prime}=-x \\
& y^{\prime}=y
\end{aligned}
$$

Question 5
Use the equations in blue above to explain why the graph of the transformed function - which contains all points on the trace of $P^{\prime}$ - can be expressed as $-x-2 y=5$.

## Question 6

On page 2.1, navigate to the Graph Entry ( menu > Graph Entry/Edit > Relation). Turn off 'Relation 2' and for 'Relation 3' input rel1 $(-x, y)$, as shown on the right.
a. What is the relationship between the graph of 'Relation 3 ' and the trace of $P^{\prime}$ ?

b. Confirm that the equation of 'Relation 3' is equivalent to the equation in Question 6 above.

## Exploration 3b. Reflection in the y-axis followed by reflection in x-axis

Navigate to page 3.1 of the TI-Nspire file, Transformations3. The graph of $x-2 y=5$ is shown in blue. The reflection of this graph in the $y$-axis has the equation $-x-2 y=5$, and is shown in red. On page $3.1, P$ is a point on the graph of $-x-2 y=5$. The equation of the graph has been entered as a relation, rel2 $(x, y)$ (i.e. 'Relation $2^{\prime}$ ). The coordinates of the points shown have been stored as the variables, $P(x o, y o)$ and $P^{\prime}(x i, y i)$.

You will now explore the image of the line $x-2 y=5$ under the transformations:

- reflection in the $y$-axis
(This transformed function has equation $-x-2 y=5$ )
Followed by
- reflection in the $x$-axis (i.e. the graph of $-x-2 y=5$ is reflected in the $x$-axis).

What to do - select page 3.2. This page is a Notes application with two Maths Boxes. Click (阅) the Maths
Box so that a red dotted border appears, then input

* In the top box: $x i:=x o$ and press enter.
* In the bottom box: $y i:=-y o$ and press enter.

That is, point $P(x, y)$ maps to point $P^{\prime}(x,-y)$ under this transformation. If $P^{\prime}$ has coordinates $\left(x^{\prime}, y^{\prime}\right)$, then

$$
\begin{aligned}
& x^{\prime}=x \\
& y^{\prime}=-y
\end{aligned}
$$

## Trace of $\boldsymbol{P}^{\prime}$

The 'Geometry Trace' tool will again be used to obtain an outline of the path of $P^{\prime}$.
What to do. Activate this tool by moving the cursor to the point $P^{\prime}$ and open the context menu by pressing ctrl| + menu. Select 'Geometry Trace', then animate $P$. When $P^{\prime}$ is outside the window settings, return $P^{\prime}$ to the starting position, then exit the tool by pressing esc.
Question 7
a. Use the trace of $P^{\prime}$ to determine the equation of the transformed function.
b. Test whether your equation in part b. is correct by graphing your equation on page 3.1, using the same set of axes as the graph of the original function. You should enter your equation as 'Relation 3' (menu > Graph Entry/Edit > Relation will ensure 'Relation' is selected. (The graph of your equation should contain all points traced by $P^{\prime}$ ).
c. Find (i) the gradient and (ii) the coordinates of the axes intercepts of the graph of the transformed function.

## Question 8

On page 3.1, navigate to the Graph Entry ( menu > Graph Entry/Edit > Relation). Turn off 'Relation 3' and for 'Relation 4 ' input rel1 $(-x,-y)$, as shown on the right.

Write the equation of rel1 $(-x,-y)$ and explain why this contains all points on the trace of $P^{\prime}$.

## Generalising the equation of transformed functions involving reflections

You will now consider the form of the equation of the transformed function for any functional relation, whether linear or non-linear.
You will explore the equations of the transformed functions for all the cases in Table 1 below.
What to do. Step 1. Erase old Geometry Trace. Navigate to page 4.1. Erase the old geometry trace before starting the next problem from Table 1.

Erasing the 'Geometry Trace': move the cursor to a blank part of the graphing window and open the context menu ( $\mathrm{ctri}+$ +menu). Select 'Erase Geometry Trace'.
Technology Tip!
Step 2. Edit Equation. On page 4.1, replace the equation of 'Relation 1' with the equation of the original function for the next problem in Table 1.
For example, second problem from Table 1: Edit 'Relation 1 ' to $y=\sqrt{4-x}+1$, as shown on the right. Step 3. Edit reflections. On page 4.2, edit the Maths Boxes to match the set of transformations listed for that problem in Table 1.
Step 4. Obtain a trace of $P^{\prime}$.
Return $P$ to the original position by clicking the left control button $\mathbf{I}$.
Activate the Geometry Trace tool: move the cursor to the point $P^{\prime}$ and open the context menu by pressing ctrl| + menu. Select 'Geometry Trace', then animate $P$ by clicking the right control button . A trace of $P^{\prime}$ will be visible. When $P^{\prime}$ is outside the window settings, return $P^{\prime}$ to the starting position, then exit the tool by pressing esc.

Selecting the correct point when $P$ and $P^{\prime}$ are close together. Move the cursor close to the point you wish to select. Press the tab key until the desired point is displayed. (Repeated use of the Technology Tip! <tab> key will cycle through all nearby points and other object).

Step 5. Equation of transformed function: its graph should contain all points on the trace of $P^{\prime}$.

- Write down an equation which you believe corresponds with the transformed function.
- Test whether your equation contain all points on the trace of $P^{\prime}$. On page 4.1, enter your equation for the transformed function as 'Relation 2'.
- On page 4.1, also enter the transformed function as 'Relation 3' in the form: rel1( $a \cdot x, b \cdot x$ ) , where $a=$ $\pm 1$ and $b= \pm 1$. The graph of 'Relation 3 ' should also contain all points on the trace of $P^{\prime}$.
Step 6. Use algebra to confirm the equation of the transformed function.
For reflections in axes, the point $P(x, y)$ maps to point $P^{\prime}( \pm 1 \cdot x, \pm 1 \cdot y)$; that is, if $P^{\prime}$ has coordinates ( $x^{\prime}, y^{\prime}$ ), then $x^{\prime}= \pm 1 \cdot x$ and $y^{\prime}= \pm 1 \cdot y$.
Confirm algebraically the equation of the transformed function. Repeat Steps $1-6$ for the next problem in Table 1.
Question 9
Follow Steps 1-6 above for each original equation below and complete the table.

| Original equation | Dilation of factor: TABLE 1 | Equation of transformed function |
| :--- | :--- | :--- |
| a. $2 x-5 y-10=0$ | Reflection in x-axis followed by reflection in <br> $y$-axis |  |
| b. $y=\sqrt{4-x}+1$ | Reflection in y-axis |  |
| c. $y=\sqrt{4-x}+1$ | Reflection in x-axis |  |

| d. $\quad y=\sqrt{4-x}+1$ | Reflection in $y$-axis followed by reflection in <br> $x$-axis |  |
| :--- | :--- | :--- | :--- |
| e. $y=\frac{(x+4)^{2}-2}{2}$ | Reflection in $x$-axis |  |
| f. $y=\frac{(x+4)^{2}-2}{2}$ | Reflection in $y$-axis |  |
| g. $y=\frac{(x+4)^{2}-2}{2}$ | Reflection in $x$-axis followed by reflection in <br> $y$-axis |  |

## Question 10

Show all working used in Step 6 above to obtain the equation of the transformed function using algebra. Graph your equation to verify that it is an equivalent form of the equation from Step 5.

## Exploration 3c. Combinations of transformations

In the transformations considered so far, the order in which the sequence of transformations was carried out made no difference to the final equation of the transformed function. You will now consider some cases where order does matter.
3c.i. Reflection in $y$-axis followed by a translation in the direction of the $x$-axis
The function with equation $4 x+5 y=10$ undergoes the following sequence of transformations:

- reflection in the y-axis
followed by
- translation of 3 units in the direction of the positive $x$-axis (i.e 3 units right).

You will explore this sequence of transformations graphically, using the instructions below.
What to do. Navigate to page 5.1 of the TI-Nspire document. The graph of $4 x+5 y=10$ has been entered as 'Relation 1 ' (rel1 $(x, y)$ ).
Consider 'reflection in the $\mathbf{y}$-axis'.
Navigate to the Graph Entry (menu) > Graph Entry/Edit > Relation).
For 'Relation 2' (rel2 $(x, y)$ ) input rel1 $(-x, y)$. * Now consider 'followed by translation of 3 units in the direction of the positive $x$-axis'.

Navigate to the Graph Entry ( menu > Graph Entry/Edit > Relation). For 'Relation 3' (rel3 $(x, y)$ ) input $\operatorname{rel2}(x-3, y)$.
Question 11
a. Determine the equation of 'Relation 2 ' (the equation after the reflection) and the equation of 'Relation 3 ' (the equation after the reflection followed by the translation).
Express the equation to 'Relation 3 ' in the form $y=m \cdot x+c$.
Check your equations as follows. Add a Calculator page as page 4.2 (press ctrirl$+{ }_{2}^{r}+$ page ${ }_{\lrcorner}>$Add Calculator). In the calculator page, input rel2 $(x, y)$ and <enter>. Then input input rel3 $(x, y)$ and <enter>. Solve the equation for $y$ to express the answer in the form $y=m \cdot x+c$.
b. Explain why rel3 $(x, y)$ gives the final equation of the transformed function.

## 3c.ii. Translation in the direction of the $x$-axis followed by reflection in $y$-axis

You will now explore whether reversing the order in which this sequence of transformation is applied produces the same or a different transformed function.

For this exploration, the function with equation $4 x+5 y=10$ undergoes the following sequence of transformations:

- translation of 3 units in the direction of the positive $x$-axis (i.e 3 units right) followed by
- reflection in the $y$-axis.

What to do. Navigate to page 6.1 of the TI-Nspire document. The graph of $4 x+5 y=10$ has been entered as rel1 $(x, y)$. * Consider 'translation of 3 units in the direction of the positive $x$ axis'.

Navigate to the Graph
Entry ( menu > Graph Entry/Edit > Relation). For 'Relation 2'
(rel2 $(x, y))$ input rel1 $(x-3, y)$.

* Now consider 'translation 3 units in the direction of the positive $x$-axis followed by reflection in the $y$ axis.
Navigate to the Graph Entry ( menu $>$ Graph Entry/Edit > Relation). For 'Relation 3' (rel3 $(x, y)$ ) input rel2 $(-x, y)$.
Question 12
a. Determine the equation of 'Relation 2 ' (the equation after the translation) and the equation of 'Relation 3 ' (the equation after the translation followed by the reflection).
Express the equation to 'Relation 3 ' in the form $y=m \cdot x+c$.
Check your equations as follows. Add a Calculator page as page 6.2 (press ctril $+_{2}^{r}+$ page $_{\lrcorner}{ }^{\prime}>$ Add Calculator). In the calculator page, input rel2 $(x, y)$ and <enter>. Then input rel3 $(x, y)$ and <enter>. Solve the equation for $y$ to express the answer in the form $y=m \cdot x+c$.
b. Explain why (for this particular sequence of transformations) reversing the order in which the transformations are applied results in a different transformed function.

## Question 13

Consider the function with equation $y=\sqrt{6-x}$ undergoing the following sequence of transformations:

- translation of 2 units in the direction of the negative $x$-axis (i.e 2 units left) followed by
- dilation of factor $\frac{1}{2}$ from the $y$-axis (i.e. parallel to the $x$-axis).
a. Determine the equation of the transformed function.
b. Navigate to page 7.1 of the TI-Nspire document. Use a method similar to that used in Question 11 above to check your equation.

## Question 14

Now consider the function with equation $y=\sqrt{6-x}$ undergoing the sequence of transformations in reverse order. That is:

- dilation of factor $\frac{1}{2}$ from the $y$-axis (i.e. parallel to the $x$-axis) followed by
- translation of 2 units in the direction of the negative $x$-axis (i.e 2 units left).
a. Determine the equation of the transformed function.
b. Navigate to page 8.1 of the TI-Nspire document. Use a method similar to that used in Question 12 above to check your equation.
c. Explain why (for this sequence of transformations) reversing the order in which the transformations are applied results in a different transformed function.
