

Problem 1 – Zeros of a Parabola

To find the zeros of the function $f(x) = 7x^2 + 62x - 9$ by graphing, first enter the function as Y1.

Adjust the graphing window to the settings shown. And press **GRAPH** to view the graph.

Press **TRACE** **FORMAT** Use the left and right arrows to move the cursor along the graph and locate the zeros.

Zeros of a polynomial are the **x-values**. The location (x, 0) is referred to as the **x-intercept**.

- How many zeros does this graph have?
- What are the zeros, approximately?

Notice that these zeros are not exact. This is a limitation of finding results graphically. To find the exact value of this zero (if it is rational), the Rational Zero Theorem must be applied.

The **Rational Zero Theorem** states that all potential rational zeros of a polynomial are of the form $\frac{P}{Q}$, where P represents all positive and negative factors of the *last* term of the polynomial and Q represents all positive and negative factors of the *first* term of the polynomial.

For this polynomial, $7x^2 + 62x - 9$, the possible rational zeros are:

$$\frac{P}{Q} = \frac{\pm 1, \pm 3, \pm 9}{\pm 1, \pm 7} = \pm 1, \pm 3, \pm 9, \pm \frac{1}{7}, \pm \frac{3}{7}, \pm \frac{9}{7}$$

Watch Your P's and Q's

We can find the exact zeros of the function by making a list. Press **[STAT]** then **[ENTER]** and enter all of the potential zeros into **L1**. You should have 12 entries.

L1	L2	L3	1
-1	-----	-----	
3			
-3			
9			
-9			
.14286			
L1(1)=1			

Highlight **L2**. Enter **Y1(L1)** and then press **[ENTER]** to calculate the value of the function at each of these potential zeros.

L1	L2	L3	2
1	-----	-----	
-1			
3			
-3			
9			
-9			
.14286			
L2=Y1(L1)			

Scroll up and down the list. Where is the value of the function zero?

- What are the exact zeros of this function?

You can also calculate the zeros of a graph using the **Zero** command. Press **[2nd]** **[TRACE]** to open the **Calculate** menu and chose **2:zero**.

Calculate
1:value
2:zero
3:minimum
4:maximum
5:intersect
6:dy/dx
7:∫f(x)dx

Move the cursor to the left of the zero and press **[ENTER]**. Then move the cursor to the right of the zero and press **[ENTER]** again. Then make a guess and press **[ENTER]** again. The calculator displays the coordinates of the x-intercept.

- Use the **zero** command to check your answers.

Problem 2 – Zeros of a cubic function

In this problem, you will find the zeros of a cubic function.
Enter the function $f(x) = 7x^3 + 26x^2 - 92x + 24$ in Y1.

```

Plot1 Plot2 Plot3
Y1=7X^3+26X^2-92
X+24
Y2=
Y3=
Y4=
Y5=
Y6=

```

Adjust the graphing window to the settings shown.

```

WINDOW
Xmin=-10
Xmax=10
Xscl=1
Ymin=-100
Ymax=400
Yscl=25
Xres=1

```

Trace the graph and locate the zeros.

- How many zeros does this graph have?
- What are the zeros, approximately?
- Identify all the possible rational zeros using the Rational Zero Theorem

L1	L2	L3	Z
1	-35	-----	
-1	135		
2	0		
-2	256		
3	171		
-3	345		
4	520		
L2(1) = -35			

Enter these results in L1. (There should be 32 entries.)

- What are the zeros of this function?
- Use the **zero** command to check your answers.

Exercises

1. Use the method described in the activity to find the rational zeros for $-10x^3 + 15x^2 + 16x - 12$.

2. How could synthetic division be used to help find the other zeros for the polynomial in Exercise 1? Use this to find the other zeros.

3. Is it possible for a polynomial to not have any rational zeros? or any zeros at all? Explain.

4. An object that is launched vertically from a point s_0 above the ground at an initial speed of v_0 feet per second. Its vertical distance above the ground is given by the equation $s = -16t^2 + v_0t + s_0$. Determine how long an object with velocity of 300 ft/sec will stay in the air if thrown upwards from a height of 5 feet.
