## Holt Physics Chapter 11 Pendulum Activity Sheet

In this graphing calculator activity, you will enter the period (T) of a pendulum on Earth. The calculator will determine L, the length of the pendulum, from the following equation:

$$
\mathrm{L}=\left(9.81 \mathrm{~T}^{2}\right) /\left(4 \pi^{2}\right)
$$

Using this length, the calculator will display a graph showing how the period of this pendulum $\left(\mathrm{Y}_{1}\right)$ changes with changes in the free-fall acceleration $(\mathrm{X})$, as given by the following equation:

$$
\mathrm{Y}_{1}=2 \pi \sqrt{(\mathrm{~L} / \mathrm{X})}
$$

From this graph, you will be able to calculate the period of a pendulum on different planets, which have different values for free-fall acceleration.

Download the VIB program to your TI-83/84 calculator. Press PRGM, then scroll down to VIB by pressing $\square$. Press ENTER twice to start the program. Enter the value for the period on Earth (see below). The calculator will produce a graph of period vs. free-fall acceleration. Use TRACE to determine the period on different planets (see below). Press 2nd [QUIT] to stop viewing the graph. Press ENTER to restart the program.
a. Why does the number 9.81 appear in the equation for L given above?
b. Calculate the periods of oscillation on different planets for two pendulums: one with a period of 2.0 s on Earth and the other with a period of 6.0 s on Earth.

| Earth <br> $\left(g=9.81 \mathrm{~m} / \mathrm{s}^{2}\right)$ | Mars <br> $\left(\mathrm{g}=3.71 \mathrm{~m} / \mathrm{s}^{2}\right)$ | Venus <br> $\left(\mathrm{g}=8.78 \mathrm{~m} / \mathrm{s}^{2}\right)$ | Neptune <br> $\left(\mathrm{g}=11.8 \mathrm{~m} / \mathrm{s}^{2}\right)$ |
| :---: | :---: | :---: | :---: |
| 2.0 s |  |  |  |
| 6.0 s |  |  |  |

c. The period of a pendulum $\qquad$ (increases, decreases, remains the same) as the free-fall acceleration increases.
d. The ratio on the periods of two pendulums $\qquad$ (increases, decreases, remains the same) as the free-fall acceleration increases.
e. The length of the pendulum with period 6.00 s is $\qquad$ (longer than, shorter than, the same as) the length of the pendulum with period 2.00 s .

## Holt Physics Chapter 11 Pendulum Activity Sheet

## ANSWER KEY

a. Why does the number 9.81 appear in the equation for L given above? This is the free-fall acceleration constant on Earth, $9.81 \mathrm{~m} / \mathrm{s}^{2}$.
b. Calculate the periods of oscillation on different planets for two pendulums: one with a period of 2.00 s on Earth and the other with a period of 6.00 s on Earth.

| Earth <br> $\left(\mathrm{g}=9.81 \mathrm{~m} / \mathrm{s}^{2}\right)$ | Mars <br> $\left(\mathrm{g}=3.71 \mathrm{~m} / \mathrm{s}^{2}\right)$ | Venus <br> $\left(\mathrm{g}=8.78 \mathrm{~m} / \mathrm{s}^{2}\right)$ | Neptune <br> $\left(\mathrm{g}=11.8 \mathrm{~m} / \mathrm{s}^{2}\right)$ |
| :---: | :---: | :---: | :---: |
| 2.00 s | 3.25 s | 2.11 s | 1.82 s |
| 6.00 s | 9.76 s | 6.34 s | 5.47 s |

c. The period of a pendulum $\qquad$ (increases, decreases, remains the same) as the free-fall acceleration increases.
decreases
d. The ratio on the periods of two pendulums $\qquad$ (increases, decreases, remains the same) as the free-fall acceleration increases.
remains the same
e. The length of the pendulum with period 6.00 s is $\qquad$ (longer than, shorter than, the same as) the length of the pendulum with period 2.00 s .
longer than
