## INVESTIGATION 31

## Application: Statistics

Skill: Finding statistics and drawing box plots

## A Weekend at the Movies! <br> 

Each weekend many people go to the movies. Below is a table of the top ten movies attended one weekend. For each of the movies an estimate is given in weekend ticket sales and the number of theaters in which the movie was shown.

| Rank of Movie |  | Ticket Sales |  |
| :--- | :--- | :--- | :--- |
|  |  |  | $\underline{\text { Number }}$ |
| 2 | $\$ 5,700,000$ |  | 2,745 |
| 3 | $\$ 5,500,000$ |  | 2,352 |
| 4 | $\$ 5,100,000$ |  | 2,427 |
| 5 | $\$ 4,700,000$ |  | 1,469 |
| 6 | $\$ 2,600,000$ | 2,007 |  |
| 7 | $\$ 2,500,000$ | 2,461 |  |
| 8 | $\$ 2,450,000$ | 2,250 |  |
| 9 | $\$ 2,300,000$ | 131 |  |
| 10 | $\$ 2,000,000$ | 581 |  |
|  | $\$ 2,000,000$ | 1,997 |  |

## Solve this problem...

Raw data is analyzed using statistics. Find the statistics of the weekend ticket sales by first entering the data into the graphing calculator. On most graphing calculators this is within a list in the statistics data editor. Clear all old statistical data before the new data is entered. After entering the data, exit the data editor and compute the one-variable statistics for the data set. Press the down arrow key to see additional statistics.

$\qquad$

INVESTIGATION 31 continued
Five numbers are of interest. These five numbers are the minimum, first quartile, second quartile, third quartile, and maximum. The second quartile (Q2) is often called the median. The median is the middle-most value or the 50th percentile of the data set. The 50th percentile means that $50 \%$ of the data is less than this value and $50 \%$ of the data is greater than this value. The first quartile (Q1) and third (Q3) quartile are the 25th and 75 th percentiles respectively. The minimum (Min) and maximum (Max) are the smallest and largest values in the data set.

The graphing calculator's output shows that the 25 th percentile (Q1) in sales is $\$ 2,300,000$. The median or 50 th percentile is $\$ 2,550,000$ in ticket sales. The 75 th percentile in sales is $\$ 5,100,000$.

The minimum sales for a top ten movie is $\$ 2,000,000$, whereas the maximum sales is $\$ 5,700,000$.

A boxplot will represent the distribution of ticket sales. Draw the boxplot by entering the statistical graphing menu on the calculator. Turn the first statplot on and set it for one-variable data. Choose the boxplot and set an appropriate viewing window to see the boxplot.

An appropriate viewing window would have ymin set to 0 and a ymax set to 1 . Set xmin to a number a little less than the minimum of the data set $(1,000,000)$, and set xmax to a number a little more than the maximum of the data set $(6,000,000)$. Set the xscl for appropriate spacing $(1,000,000)$. Press the graphing key to view the box plot.

The box represents the middle $50 \%$ of the sales. The left side of the box is the 25 th percentile and the right side is the 50 th percentile. The left horizontal line off the box represents the lower $25 \%$ and the right horizontal line represents the upper $25 \%$. The left endpoint is the minimum and the right endpoint is the maximum. The vertical line inside the box represents the median.

## Solve this problem...

3. The total sales for each of the top ten movies since their release is shown in the table below. Find the statistics and boxplot for the data.

| $\underline{\text { Movie }}$ |  | Total Sales |
| :--- | :--- | :--- |
| 1 |  | $\$ 17,300,000$ |
| 2 |  | $\$ 5,500,000$ |
| 3 |  | $\$ 50,900,000$ |
| 4 |  | $\$ 13,600,000$ |
| 5 |  | $\$ 145,700,000$ |
| 6 |  | $\$ 82,200,000$ |
| 7 |  | $\$ 55,000,000$ |
| 8 |  | $\$ 2,400,000$ |
| 9 |  | $\$ 2,000,000$ |
| 10 |  | $\$ 151,700,000$ |

Minimum $=$ $\qquad$
Q1 = $\qquad$
Median $=$ Q2 = $\qquad$

Q3 = $\qquad$

Maximum = $\qquad$
4. Find the boxplot for the number of theaters. Draw what you find in the box provided below.
