Cropland Value Grows

Focus Questions:

- According to the USA TODAY Snapshot "Cropland value grows," explain what would represent the independent and the dependent variables?
- Determine the "rate of change" in average cropland value per year and interpret the meaning of this value.
- Estimate the average value per acre of U.S. farm cropland in 2004 and 1996.

Activity Overview:

You will explore the data in the USA TODAY Snapshot® "Cropland value grows" to determine the rate at which the average value per acre of U.S. cropland is changing. You will determine a mathematical model for the data and use the model to make a prediction about the value of an acre based on this data for years not shown in the Snapshot. You will create a scatter plot of the data for the years 1997 through 2003, using appropriate labels based on the data in the Snapshot.

This activity was created for use with
Texas Instruments handheld technology.

Cropland Value Grows

Procedure:

Step 1

According to the USA TODAY Snapshot "Cropland value grows," explain what would represent the independent and the dependent variables?

- Independent variable _____
- Dependent variable _____

Step 2

Determine the "rate of change" in average cropland value per year and interpret the meaning of this value.

- Enter the data from USA TODAY Snapshot "Cropland value grows" in two lists.
- Use the regression capabilities of the graphing handheld to determine the mathematical model.
- Mathematical model: _____
- Using your model above, what value represents the "rate of change"?

- What is the meaning of the "rate of change"?

Step 3

Estimate the average value per acre of U.S. cropland in 2004 and 1996.

- Average value per acre of U.S. cropland in 2004 _____
- Average value per acre of U.S. cropland in 1996 _____
