TEXAS INSTRUMENTS

TI-Nspire™ CX CAS Reference Guide

Important Information

Except as otherwise expressly stated in the License that accompanies a program, Texas Instruments makes no warranty, either express or implied, including but not limited to any implied warranties of merchantability and fitness for a particular purpose, regarding any programs or book materials and makes such materials available solely on an "as-is" basis. In no event shall Texas Instruments be liable to anyone for special, collateral, incidental, or consequential damages in connection with or arising out of the purchase or use of these materials, and the sole and exclusive liability of Texas Instruments, regardless of the form of action, shall not exceed the amount set forth in the license for the program. Moreover, Texas Instruments shall not be liable for any claim of any kind whatsoever against the use of these materials by any other party.

Contents

Expression Templates

Expression templates give you an easy way to enter math expressions in standard mathematical notation. When you insert a template, it appears on the entry line with small blocks at positions where you can enter elements. A cursor shows which element you can enter.

Position the cursor on each element, and type a value or expression for the element.

Fraction template	$\boxed{\text{ctrl}}\ \boxed{\div}$ **keys**

$\dfrac{\square}{\square}$ **Note:** See also **/ (divide)**, page 212.

Example:

$$\frac{12}{8\cdot2} \qquad\qquad \frac{3}{4}$$

Exponent template	$\boxed{\wedge}$ **key**

$\square^{\square}$

Note: Type the first value, press $\boxed{\wedge}$, and then type the exponent. To return the cursor to the baseline, press right arrow ($\blacktriangleright$).

Note: See also **^ (power)**, page 213.

Example:

$$2^3 \qquad\qquad 8$$

Square root template	$\boxed{\text{ctrl}}\ \boxed{x^2}$ **keys**

$\sqrt{\square}$ **Note:** See also **√() (square root)**, page 223.

Example:

$$\sqrt{4} \qquad\qquad 2$$
$$\sqrt{\{9,a,4\}} \qquad\qquad \{3,\sqrt{(a)},2\}$$

$$\sqrt{4} \qquad\qquad 2$$
$$\sqrt{\{9,16,4\}} \qquad\qquad \{3,4,2\}$$

Nth root template	$\boxed{\text{ctrl}}\ \boxed{\wedge}$ **keys**

$\sqrt[\square]{\square}$ **Note:** See also **root()**, page 154.

Example:

Nth root template	$\boxed{\text{ctrl}}$ $\boxed{\wedge}$ **keys**

$$\sqrt[3]{8} \qquad\qquad 2$$

$$\sqrt[3]{\{8,27,b\}} \qquad\qquad \left\{2,3,b^{\frac{1}{3}}\right\}$$

e exponent template	$\boxed{e^x}$ **keys**

$$e^{\Box}$$

Natural exponential *e* raised to a power

Note: See also **e^()**, page 57.

Example:

$$e^{1} \qquad\qquad e$$

$$e^{1.} \qquad\qquad 2.71828182846$$

Log template	$\boxed{\text{ctrl}}$ $\boxed{10^x}$ **key**

$$\log_{\Box}\left(\Box\right)$$

Calculates log to a specified base. For a default of base 10, omit the base.

Note: See also **log()**, page 106.

Example:

$$\log_{4}(2.) \qquad\qquad 0.5$$

| **Piecewise template (2-piece)**	**Catalog >** $\boxed{\text{\tiny|0||0|}}$

$$\begin{cases} \Box, \Box \\ \Box, \Box \end{cases}$$
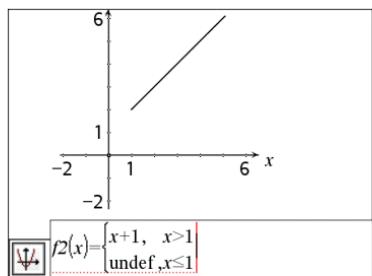

Lets you create expressions and conditions for a two-piece piecewise function. To add a piece, click in the template and repeat the template.

Note: See also **piecewise()**, page 132.

Example:

$$f2(x)=\begin{cases} x+1, & x>1 \\ \text{undef}, & x\le1 \end{cases}$$
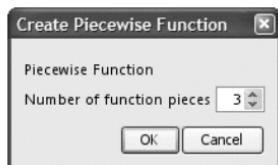

Piecewise template (N-piece)

Lets you create expressions and conditions for an N-piece piecewise function. Prompts for N.

Example:

See the example for Piecewise template (2-piece).

Create Piecewise Function

Piecewise Function

Number of function pieces 3

OK   Cancel

Note: See also **piecewise()**, page 132.

System of 2 equations template

$$\begin{cases} \square \\ \square \end{cases}$$

Creates a system of two equations. To add a row to an existing system, click in the template and repeat the template.

Note: See also **system()**, page 181.

Example:
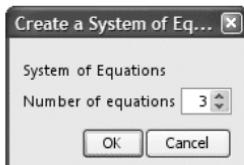

$$\text{solve}\left(\begin{cases} x+y=0 \\ x-y=5 \end{cases}, x,y\right) \quad x=\frac{5}{2} \text{ and } y=\frac{-5}{2}$$

$$\text{solve}\left(\begin{cases} y=x^2-2 \\ x+2\cdot y=-1 \end{cases}, x,y\right)$$

$$x=\frac{-3}{2} \text{ and } y=\frac{1}{4} \text{ or } x=1 \text{ and } y=-1$$

System of N equations template

Lets you create a system of N equations. Prompts for N.

Example:

See the example for System of equations template (2-equation).

Create a System of Eq...

System of Equations

Number of equations 3

OK   Cancel

Note: See also **system()**, page 181.

Absolute value template

$$|\square|$$ **Note:** See also **abs()**, page 8.

Example:

Absolute value template	

$$\left|\left\{2,-3,4,-4^3\right\}\right| \qquad \left\{2,3,4,64\right\}$$

dd°mm′ss.ss″ template	

$\square°\square'\square''$

Lets you enter angles in **dd°mm′ss.ss″** format, where **dd** is the number of decimal degrees, **mm** is the number of minutes, and **ss.ss** is the number of seconds.

Example:

$$30°15'10'' \qquad \frac{10891\cdot\pi}{64800}$$

Matrix template (2 x 2)	

$\begin{bmatrix} \square & \square \\ \square & \square \end{bmatrix}$

Creates a 2 x 2 matrix.

Example:

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}\cdot a \qquad \begin{bmatrix} a & 2\cdot a \\ 3\cdot a & 4\cdot a \end{bmatrix}$$

Matrix template (1 x 2)	

$\begin{bmatrix} \square & \square \end{bmatrix}$.

Example:

$$\text{crossP}\left(\begin{bmatrix} 1 & 2 \end{bmatrix},\begin{bmatrix} 3 & 4 \end{bmatrix}\right) \qquad \begin{bmatrix} 0 & 0 & -2 \end{bmatrix}$$

Matrix template (2 x 1)	

$\begin{bmatrix} \square \\ \square \end{bmatrix}$

Example:

$$\begin{bmatrix} 5 \\ 8 \end{bmatrix}\cdot 0.01 \qquad \begin{bmatrix} 0.05 \\ 0.08 \end{bmatrix}$$

Matrix template (m x n)	
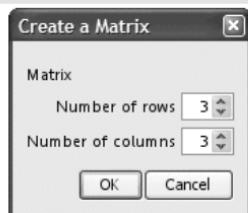

The template appears after you are prompted to specify the number of rows and columns.

Example:

$$\text{diag}\left(\begin{bmatrix} 4 & 2 & 6 \\ 1 & 2 & 3 \\ 5 & 7 & 9 \end{bmatrix}\right) \qquad \begin{bmatrix} 4 & 2 & 9 \end{bmatrix}$$

Matrix template (m x n)

Create a Matrix

Matrix

Number of rows 3

Number of columns 3

[OK] [Cancel]

Note: If you create a matrix with a large number of rows and columns, it may take a few moments to appear.

Sum template (Σ)

$$\sum_{\square=\square}^{\square}(\square)$$

Example:

$$\sum_{n=3}^{7}(n) \qquad 25$$

Note: See also Σ**()** (**sumSeq**), page 224.

Product template (Π)

$$\prod_{\square=\square}^{\square}(\square)$$

Example:

$$\prod_{n=1}^{5}\left(\frac{1}{n}\right) \qquad \frac{1}{120}$$

Note: See also Π**()** (**prodSeq**), page 223.

First derivative template

$$\frac{d}{d\square}(\square)$$

The first derivative template can also be used to calculate first derivative at a point.

Note: See also **d() (derivative)**, page 221.

Example:

$$\frac{d}{dx}\left(x^3\right) \qquad 3\cdot x^2$$

$$\frac{d}{dx}\left(x^3\right)|x=3 \qquad 27$$

Second derivative template

$$\frac{d^2}{d\square^2}(\square)$$

The second derivative template can also be used to calculate second derivative at a point.

Note: See also **d() (derivative)**, page 221.

Example:

$$\frac{d^2}{dx^2}(x^3) \qquad 6 \cdot x$$

$$\frac{d^2}{dx^2}(x^3)\big|_{x=3} \qquad 18$$

Nth derivative template

$$\frac{d^\square}{d\square^\square}(\square)$$

The *n*th derivative template can be used to calculate the *n*th derivative.

Note: See also **d() (derivative)**, page 221.

Example:

$$\frac{d^3}{dx^3}(x^3)\big|_{x=3} \qquad 6$$

Definite integral template

$$\int_{\square}^{\square} \square\, d\square$$

Note: See also ∫() **integral()**, page 221.

Example:

$$\int_a^b x^2\, dx \qquad \frac{b^3}{3} - \frac{a^3}{3}$$

Indefinite integral template

$$\int \square\, d\square$$

Note: See also ∫() **integral()**, page 221.

Example:

$$\int x^2\, dx \qquad \frac{x^3}{3}$$

Limit template

$$\lim_{\square \to \square^\square}(\square)$$

Example:

$$\lim_{x \to 5}(2\cdot x + 3) \qquad 13$$

Limit template

Use − or (−) for left hand limit. Use + for
right hand limit.

Note: See also **limit()**, page 6.

Alphabetical Listing

Items whose names are not alphabetic (such as +, !, and >) are listed at the end of this section, page 210. Unless otherwise specified, all examples in this section were performed in the default reset mode, and all variables are assumed to be undefined.

A

---

abs() Catalog > 📖

abs(*Expr1***)** ⇒ *expression*

abs(*List1***)** ⇒ *list*
abs(*Matrix1***)** ⇒ *matrix*

Returns the absolute value of the argument.

Note: See also **Absolute value template**, page 3.

If the argument is a complex number, returns the number's modulus.

Note: All undefined variables are treated as real variables.

$$\left|\left\{\frac{\pi}{2}, \frac{-\pi}{3}\right\}\right| \qquad\qquad \left\{\frac{\pi}{2}, \frac{\pi}{3}\right\}$$

$$|2-3\cdot i| \qquad\qquad \sqrt{13}$$

$$|z| \qquad\qquad |z|$$

$$|x+y\cdot i| \qquad\qquad \sqrt{x^2+y^2}$$

---

amortTbl() Catalog > 📖

amortTbl(*NPmt***,***N***,***I***,***PV***,** [*Pmt*]**,** [*FV*]**,**
[*PpY*]**,** [*CpY*]**,** [*PmtAt*]**,** [*roundValue*]**)** ⇒ *matrix*

Amortization function that returns a matrix as an amortization table for a set of TVM arguments.

NPmt is the number of payments to be included in the table. The table starts with the first payment.

N, *I*, *PV*, *Pmt*, *FV*, *PpY*, *CpY*, and *PmtAt* are described in the table of TVM arguments, page 195.

- If you omit *Pmt*, it defaults to
  Pmt=**tvmPmt**
  (*N***,***I***,***PV***,***FV***,***PpY***,***CpY***,***PmtAt***)**.
- If you omit *FV*, it defaults to *FV*=0.
- The defaults for *PpY*, *CpY*, and *PmtAt* are the same as for the TVM functions.

amortTbl$(12,60,10,5000,,,12,12)$

$$\begin{bmatrix} 0 & 0. & 0. & 5000. \\ 1 & -41.67 & -64.57 & 4935.43 \\ 2 & -41.13 & -65.11 & 4870.32 \\ 3 & -40.59 & -65.65 & 4804.67 \\ 4 & -40.04 & -66.2 & 4738.47 \\ 5 & -39.49 & -66.75 & 4671.72 \\ 6 & -38.93 & -67.31 & 4604.41 \\ 7 & -38.37 & -67.87 & 4536.54 \\ 8 & -37.8 & -68.44 & 4468.1 \\ 9 & -37.23 & -69.01 & 4399.09 \\ 10 & -36.66 & -69.58 & 4329.51 \\ 11 & -36.08 & -70.16 & 4259.35 \\ 12 & -35.49 & -70.75 & 4188.6 \end{bmatrix}$$

---

roundValue specifies the number of decimal places for rounding. Default=2.

The columns in the result matrix are in this order: Payment number, amount paid to interest, amount paid to principal, and balance.

The balance displayed in row *n* is the balance after payment *n*.

You can use the output matrix as input for the other amortization functions ∑**Int()** and ∑**Prn()**, page 225, and **bal()**, page 17.

BooleanExpr1 **and** *BooleanExpr2* ⇒ *Boolean expression*

BooleanList1 **and** *BooleanList2* ⇒ *Boolean list*

BooleanMatrix1 **and** *BooleanMatrix2* ⇒ *Boolean matrix*

Returns true or false or a simplified form of the original entry.

$x{\geq}3$ and $x{\geq}4$	$x{\geq}4$
$\{x{\geq}3,x{\leq}0\}$ and $\{x{\geq}4,x{\leq}-2\}$	$\{x{\geq}4,x{\leq}-2\}$

Integer1 **and** *Integer2* ⇒ *integer*

In Hex base mode:

0h7AC36 and 0h3D5F	0h2C16

Important: Zero, not the letter O.

Compares two real integers bit-by-bit using an **and** operation. Internally, both integers are converted to signed, 64-bit binary numbers. When corresponding bits are compared, the result is 1 if both bits are 1; otherwise, the result is 0. The returned value represents the bit results, and is displayed according to the Base mode.

In Bin base mode:

0b100101 and 0b100	0b100

You can enter the integers in any number base. For a binary or hexadecimal entry, you must use the 0b or 0h prefix, respectively. Without a prefix, integers are treated as decimal (base 10).

In Dec base mode:

37 and 0b100	4

Note: A binary entry can have up to 64 digits (not counting the 0b prefix). A hexadecimal entry can have up to 16 digits.

angle()

angle(*Expr1***)** $\Rightarrow$ *expression*

Returns the angle of the argument, interpreting the argument as a complex number.

Note: All undefined variables are treated as real variables.

In Degree angle mode:

$$\text{angle}(0+2\cdot i) \qquad 90$$

In Gradian angle mode:

$$\text{angle}(0+3\cdot i) \qquad 100$$

In Radian angle mode:

$$\text{angle}(1+i) \qquad \frac{\pi}{4}$$

$$\text{angle}(z) \qquad \frac{-\pi\cdot(\text{sign}(z)-1)}{2}$$

$$\text{angle}(x+i\cdot y) \qquad \frac{\pi\cdot\text{sign}(y)}{2}-\tan^{-1}\left(\frac{x}{y}\right)$$

angle(*List1***)** $\Rightarrow$ *list*
angle(*Matrix1***)** $\Rightarrow$ *matrix*

Returns a list or matrix of angles of the elements in *List1* or *Matrix1*, interpreting each element as a complex number that represents a two-dimensional rectangular coordinate point.

$$\text{angle}(\{1+2\cdot i, 3+0\cdot i, 0-4\cdot i\})$$
$$\left\{\frac{\pi}{2}-\tan^{-1}\left(\frac{1}{2}\right), 0, \frac{-\pi}{2}\right\}$$

ANOVA

ANOVA *List1*,*List2*[,*List3*,...,*List20*][,*Flag*]

Performs a one-way analysis of variance for comparing the means of two to 20 populations. A summary of results is stored in the *stat.results* variable. (page 176)

Flag=0 for Data, *Flag*=1 for Stats

Output variable	Description
stat.F	Value of the F statistic
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.df	Degrees of freedom of the groups
stat.SS	Sum of squares of the groups
stat.MS	Mean squares for the groups

Output variable	Description
stat.dfError	Degrees of freedom of the errors
stat.SSError	Sum of squares of the errors
stat.MSError	Mean square for the errors
stat.sp	Pooled standard deviation
stat.xbarlist	Mean of the input of the lists
stat.CLowerList	95% confidence intervals for the mean of each input list
stat.CUpperList	95% confidence intervals for the mean of each input list

ANOVA2way   Catalog > 📖

ANOVA2way *List1,List2*[*,List3,…,List10*]
[*,levRow*]

Computes a two-way analysis of variance for
comparing the means of two to 10
populations. A summary of results is stored
in the *stat.results* variable. (See page 176.)

LevRow=0 for Block

LevRow=2,3,…,*Len*-1, for Two Factor,
where *Len*=length(*List1*)=length(*List2*) = …
= length(*List10*) and *Len* / *LevRow* Î
{2,3,…}

```
Outputs: Block Design
```

Output variable	Description
stat.F	F statistic of the column factor
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.df	Degrees of freedom of the column factor
stat.SS	Sum of squares of the column factor
stat.MS	Mean squares for column factor
stat.FBlock	F statistic for factor
stat.PValBlock	Least probability at which the null hypothesis can be rejected
stat.dfBlock	Degrees of freedom for factor
stat.SSBlock	Sum of squares for factor

Output variable	Description
stat.MSBlock	Mean squares for factor
stat.dfError	Degrees of freedom of the errors
stat.SSError	Sum of squares of the errors
stat.MSError	Mean squares for the errors
stat.s	Standard deviation of the error

COLUMN FACTOR Outputs

Output variable	Description
stat.Fcol	F statistic of the column factor
stat.PValCol	Probability value of the column factor
stat.dfCol	Degrees of freedom of the column factor
stat.SSCol	Sum of squares of the column factor
stat.MSCol	Mean squares for column factor

ROW FACTOR Outputs

Output variable	Description
stat.FRow	F statistic of the row factor
stat.PValRow	Probability value of the row factor
stat.dfRow	Degrees of freedom of the row factor
stat.SSRow	Sum of squares of the row factor
stat.MSRow	Mean squares for row factor

INTERACTION Outputs

Output variable	Description
stat.FInteract	F statistic of the interaction
stat.PValInteract	Probability value of the interaction
stat.dfInteract	Degrees of freedom of the interaction
stat.SSInteract	Sum of squares of the interaction
stat.MSInteract	Mean squares for interaction

ERROR Outputs

Output variable	Description
stat.dfError	Degrees of freedom of the errors
stat.SSError	Sum of squares of the errors
stat.MSError	Mean squares for the errors
s	Standard deviation of the error

Ans

Ans ⇒ *value*

Returns the result of the most recently evaluated expression.

56	56
56+4	60
60+4	64

approx()

approx(*Expr1***)** ⇒ *expression*

Returns the evaluation of the argument as an expression containing decimal values, when possible, regardless of the current **Auto or Approximate** mode.

This is equivalent to entering the argument and pressing $\boxed{\text{ctrl}}$ $\boxed{\text{enter}}$.

$$\text{approx}\left(\frac{1}{3}\right) \qquad 0.333333$$

$$\text{approx}\left(\left\{\frac{1}{3}, \frac{1}{9}\right\}\right) \qquad \{0.333333, 0.111111\}$$

$$\text{approx}(\{\sin(\pi), \cos(\pi)\}) \qquad \{0., -1.\}$$

$$\text{approx}\left(\begin{bmatrix} \sqrt{2} & \sqrt{3} \end{bmatrix}\right) \qquad \begin{bmatrix} 1.41421 & 1.73205 \end{bmatrix}$$

$$\text{approx}\left(\begin{bmatrix} \frac{1}{3} & \frac{1}{9} \end{bmatrix}\right) \qquad \begin{bmatrix} 0.333333 & 0.111111 \end{bmatrix}$$

approx(*List1***)** ⇒ *list*
approx(*Matrix1***)** ⇒ *matrix*

Returns a list or *matrix* where each element has been evaluated to a decimal value, when possible.

$$\text{approx}(\{\sin(\pi), \cos(\pi)\}) \qquad \{0., -1.\}$$

$$\text{approx}\left(\begin{bmatrix} \sqrt{2} & \sqrt{3} \end{bmatrix}\right) \qquad \begin{bmatrix} 1.41421 & 1.73205 \end{bmatrix}$$

►approxFraction()

Expr►**approxFraction(**[*Tol*]**)** ⇒ *expression*

List►**approxFraction(**[*Tol*]**)** ⇒ *list*

Matrix►**approxFraction(**[*Tol*]**)** ⇒ *matrix*

Returns the input as a fraction, using a tolerance of *Tol*. If *Tol* is omitted, a tolerance of 5.E-14 is used.

$$\frac{1}{2} + \frac{1}{3} + \tan(\pi) \qquad 0.833333$$

$$0.83333333333333 \blacktriangleright \text{approxFraction}(5.\text{E}-14)$$

$$\frac{5}{6}$$

$$\{\pi, 1.5\} \blacktriangleright \text{approxFraction}(5.\text{E}-14)$$

$$\left\{\frac{5419351}{1725033}, \frac{3}{2}\right\}$$

► approxFraction()	Catalog > 📖

Note: You can insert this function from the computer keyboard by typing
`@>approxFraction(...)`.

approxRational()	Catalog > 📖

approxRational($Expr$[**,** Tol]**)** $\Rightarrow$ *expression*

approxRational($List$[**,** Tol]**)** $\Rightarrow$ *list*

approxRational($Matrix$[**,** Tol]**)** $\Rightarrow$ *matrix*

Returns the argument as a fraction using a tolerance of Tol. If Tol is omitted, a tolerance of 5.E-14 is used.

$$\text{approxRational}\left(0.333, 5 \cdot 10^{-5}\right) \qquad \frac{333}{1000}$$

$$\text{approxRational}\left(\{0.2, 0.33, 4.125\}, 5.\text{E-}14\right)$$
$$\left\{\frac{1}{5}, \frac{33}{100}, \frac{33}{8}\right\}$$

arccos()	See cos⁻¹(), page 31.

arccosh()	See cosh⁻¹(), page 32.

arccot()	See cot⁻¹(), page 33.

arccoth()	See coth⁻¹(), page 34.

arccsc()	See csc⁻¹(), page 37.

arccsch()	See csch⁻¹(), page 37.

arcLen()

arcLen(*Expr1***,***Var***,***Start***,***End***)** ⇒
expression

Returns the arc length of *Expr1* from
Start to *End* with respect to variable *Var*.

Arc length is calculated as an integral
assuming a function mode definition.

arcLen(*List1***,***Var***,***Start***,***End***)** ⇒ *list*

Returns a list of the arc lengths of each
element of *List1* from *Start* to *End* with
respect to *Var*.

$$\overline{\text{arcLen}(\cos(x),x,0,\pi)} \qquad\qquad 3.8202$$

$$\overline{\text{arcLen}(f(x),x,a,b)} \qquad \int_{a}^{b} \sqrt{\left(\frac{d}{dx}(f(x))\right)^2 + 1} \, dx$$

$$\overline{\text{arcLen}(\{\sin(x),\cos(x)\},x,0,\pi)} \\ \{3.8202, 3.8202\}$$

---

arcsec()

See sec⁻¹(), page 157.

---

arcsech()

See sech⁻¹(), page 158.

---

arcsin()

See sin⁻¹(), page 167.

---

arcsinh()

See sinh⁻¹(), page 168.

---

arctan()

See tan⁻¹(), page 183.

---

arctanh()

See tanh⁻¹(), page 184.

---

augment()

augment(*List1, List2***)** ⇒ *list*

$$\overline{\text{augment}(\{1,-3,2\},\{5,4\})} \qquad \{1,-3,2,5,4\}$$

---

augment()   Catalog > 📖

Returns a new list that is *List2* appended to
the end of *List1*.

augment(*Matrix1***, ***Matrix2***)** ⇒ *matrix*

Returns a new matrix that is *Matrix2*
appended to *Matrix1*. When the ","
character is used, the matrices must have
equal row dimensions, and *Matrix2* is
appended to *Matrix1* as new columns.
Does not alter *Matrix1* or *Matrix2*.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \to m1 \qquad \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$$

$$\begin{bmatrix} 5 \\ 6 \end{bmatrix} \to m2 \qquad \begin{bmatrix} 5 \\ 6 \end{bmatrix}$$

$$\mathrm{augment}(m1,m2) \qquad \begin{bmatrix} 1 & 2 & 5 \\ 3 & 4 & 6 \end{bmatrix}$$

avgRC()   Catalog > 📖

avgRC(*Expr1***, ***Var*** [*=Value*] [**, ***Step***])** ⇒
expression

avgRC(*Expr1***, ***Var*** [*=Value*] [**, ***List1***])** ⇒
list

avgRC(*List1***, ***Var*** [*=Value*] [**, ***Step***])** ⇒
list

avgRC(*Matrix1***, ***Var*** [*=Value*] [**, ***Step***])** ⇒
matrix

Returns the forward-difference quotient
(average rate of change).

Expr1 can be a user-defined function name
(see **Func**).

When *Value* is specified, it overrides any
prior variable assignment or any current "|"
substitution for the variable.

Step is the step value. If *Step* is omitted, it
defaults to 0.001.

Note that the similar function **centralDiff()**
uses the central-difference quotient.

$\mathrm{avgRC}(f(x),x,h)$	$\dfrac{f(x+h)-f(x)}{h}$
$\mathrm{avgRC}(\sin(x),x,h)\vert x=2$	$\dfrac{\sin(h+2)-\sin(2)}{h}$
$\mathrm{avgRC}(x^2-x+2,x)$	$2.\cdot(x-0.4995)$
$\mathrm{avgRC}(x^2-x+2,x,0.1)$	$2.\cdot(x-0.45)$
$\mathrm{avgRC}(x^2-x+2,x,3)$	$2\cdot(x+1)$

bal()

bal(*NPmt***,***N***,***I***,***PV*** ,[***Pmt***]**, [***FV***]**, [***PpY***]**,
[***CpY***]**, [***PmtAt***]**, [***roundValue***]**)** ⇒ *value*

bal(*NPmt***,***amortTable***)** ⇒ *value*

Amortization function that calculates
schedule balance after a specified payment.

*N***,** *I***,** *PV*, *Pmt*, *FV*, *PpY*, *CpY*, and *PmtAt*
are described in the table of TVM
arguments, page 195.

NPmt specifies the payment number after
which you want the data calculated.

*N***,** *I***,** *PV*, *Pmt*, *FV*, *PpY*, *CpY*, and *PmtAt*
are described in the table of TVM
arguments, page 195.

- If you omit *Pmt*, it defaults to
  Pmt=**tvmPmt**
  (*N***,***I***,***PV***,***FV***,***PpY***,***CpY***,***PmtAt***)**.
- If you omit *FV*, it defaults to *FV*=0.
- The defaults for *PpY*, *CpY*, and *PmtAt*
  are the same as for the TVM functions.

roundValue specifies the number of
decimal places for rounding. Default=2.

bal(*NPmt***,***amortTable***)** calculates the
balance after payment number *NPmt*,
based on amortization table *amortTable*.
The *amortTable* argument must be a
matrix in the form described under
amortTbl(), page 8.

Note: See also Σ**Int()** and Σ**Prn()**, page 225.

bal(5,6,5.75,5000,,12,12)			833.11

tbl:=amortTbl(6,6,5.75,5000,,12,12)

bal(4,*tbl*)	1674.27

►Base2

Integer1 ►**Base2** ⇒ *integer*

Note: You can insert this operator from the
computer keyboard by typing @>**Base2**.

256►Base2	0b100000000
0h1F►Base2	0b11111

Converts *Integer1* to a binary number. Binary or hexadecimal numbers always have a 0b or 0h prefix, respectively. Use a zero, not the letter O, followed by b or h.

0b *binaryNumber*
0h *hexadecimalNumber*

A binary number can have up to 64 digits. A hexadecimal number can have up to 16.

Without a prefix, *Integer1* is treated as decimal (base 10). The result is displayed in binary, regardless of the Base mode.

Negative numbers are displayed in "two's complement" form. For example,

¯1 is displayed as
0hFFFFFFFFFFFFFFFF in Hex base mode
0b111...111 (64 1's) in Binary base mode

¯2^{63} is displayed as
0h8000000000000000 in Hex base mode
0b100...000 (63 zeros) in Binary base mode

If you enter a decimal integer that is outside the range of a signed, 64-bit binary form, a symmetric modulo operation is used to bring the value into the appropriate range. Consider the following examples of values outside the range.

2^{63} becomes ¯2^{63} and is displayed as
0h8000000000000000 in Hex base mode
0b100...000 (63 zeros) in Binary base mode

2^{64} becomes 0 and is displayed as
0h0 in Hex base mode
0b0 in Binary base mode

¯2^{63} − 1 becomes 2^{63} − 1 and is displayed as
0h7FFFFFFFFFFFFFFF in Hex base mode
0b111...111 (64 1's) in Binary base mode

►**Base10**   Catalog > 📘

Integer1 ►**Base10** ⇒ *integer*

0b10011►Base10	19
0h1F►Base10	31

►Base10

Note: You can insert this operator from the computer keyboard by typing @>**Base10**.

Converts *Integer1* to a decimal (base 10) number. A binary or hexadecimal entry must always have a 0b or 0h prefix, respectively.

0b *binaryNumber*
0h *hexadecimalNumber*

Zero, not the letter O, followed by b or h.

A binary number can have up to 64 digits. A hexadecimal number can have up to 16.

Without a prefix, *Integer1* is treated as decimal. The result is displayed in decimal, regardless of the Base mode.

►Base16

Integer1 ►**Base16** ⇒ *integer*

Note: You can insert this operator from the computer keyboard by typing @>**Base16**.

256►Base16	0h100
0b111100001111►Base16	0hF0F

Converts *Integer1* to a hexadecimal number. Binary or hexadecimal numbers always have a 0b or 0h prefix, respectively.

0b *binaryNumber*
0h *hexadecimalNumber*

Zero, not the letter O, followed by b or h.

A binary number can have up to 64 digits. A hexadecimal number can have up to 16.

Without a prefix, *Integer1* is treated as decimal (base 10). The result is displayed in hexadecimal, regardless of the Base mode.

If you enter a decimal integer that is too large for a signed, 64-bit binary form, a symmetric modulo operation is used to bring the value into the appropriate range. For more information, see ►**Base2**, page 17.

binomCdf()

binomCdf(*n*,*p***)** ⇒ *list*

binomCdf(*n*,*p*,*lowBound*,*upBound***)** ⇒
number if *lowBound* and *upBound* are
numbers, *list* if *lowBound* and *upBound* are
lists

binomCdf(*n*,*p*,*upBound***)**for P(0≤X≤*upBound*)
⇒ *number* if *upBound* is a number, *list* if
upBound is a list

Computes a cumulative probability for the
discrete binomial distribution with *n* number
of trials and probability *p* of success on each
trial.

For P(X ≤ *upBound*), set *lowBound*=0

binomPdf()

binomPdf(*n*,*p***)** ⇒ *list*

binomPdf(*n*,*p*,*XVal***)** ⇒ *number* if *XVal* is a
number, *list* if *XVal* is a list

Computes a probability for the discrete
binomial distribution with *n* number of trials
and probability *p* of success on each trial.

C

ceiling(*Expr1***)** ⇒ *integer*

Returns the nearest integer that is ≥ the
argument.

The argument can be a real or a complex
number.

Note: See also **floor()**.

ceiling(.456)	1.

ceiling(*List1***)** ⇒ *list*
ceiling(*Matrix1***)** ⇒ *matrix*

Returns a list or matrix of the ceiling of
each element.

$$\text{ceiling}(\{-3.1,1,2.5\}) \quad \{-3.,1,3.\}$$

$$\text{ceiling}\begin{bmatrix} 0 & -3.2 \cdot i \\ 1.3 & 4 \end{bmatrix} \quad \begin{bmatrix} 0 & -3. \cdot i \\ 2. & 4 \end{bmatrix}$$

centralDiff()   Catalog >

centralDiff(*Expr1***,***Var* [*=Value*][*,Step*]**)** ⇒
expression

centralDiff(*Expr1***,***Var* [*,Step*]**)|***Var=Value*
⇒ *expression*

centralDiff(*Expr1***,***Var* [*=Value*][*,List*]**)** ⇒
list

centralDiff(*List1***,***Var* [*=Value*][*,Step*]**)** ⇒
list

centralDiff(*Matrix1***,***Var* [*=Value*][*,Step*]**)**
⇒ *matrix*

Returns the numerical derivative using the
central difference quotient formula.

When *Value* is specified, it overrides any
prior variable assignment or any current "|"
substitution for the variable.

Step is the step value. If *Step* is omitted, it
defaults to 0.001.

When using *List1* or *Matrix1*, the operation
gets mapped across the values in the list or
across the matrix elements.

Note: See also **avgRC()** and ***d*()**.

$$\text{centralDiff}(\cos(x),x,h)$$
$$\frac{-(\cos(x-h)-\cos(x+h))}{2 \cdot h}$$

$$\lim_{h \to 0}(\text{centralDiff}(\cos(x),x,h)) \qquad -\sin(x)$$

$$\text{centralDiff}(x^3,0.01)$$
$$3. \cdot (x^2+0.000033)$$

$$\text{centralDiff}(\cos(x),x)|x=\frac{\pi}{2} \qquad -1.$$

$$\text{centralDiff}(x^2,x,\{0.01,0.1\})$$
$$\{2.\cdot x, 2.\cdot x\}$$

cFactor()   Catalog >

cFactor(*Expr1*[*,Var*]**)** ⇒ *expression*
cFactor(*List1*[*,Var*]**)** ⇒ *list*
cFactor(*Matrix1*[*,Var*]**)** ⇒ *matrix*

cFactor(*Expr1***)** returns *Expr1* factored with
respect to all of its variables over a
common denominator.

Expr1 is factored as much as possible
toward linear rational factors even if this
introduces new non-real numbers. This
alternative is appropriate if you want
factorization with respect to more than one
variable.

$$\text{cFactor}(a^3 \cdot x^2 + a \cdot x^2 + a^3 + a, x)$$
$$a \cdot (a^2+1) \cdot (x-\boldsymbol{i}) \cdot (x+\boldsymbol{i})$$

$$\text{cFactor}\left(x^2+\frac{4}{9}\right) \qquad \frac{(3 \cdot x - 2 \cdot \boldsymbol{i}) \cdot (3 \cdot x + 2 \cdot \boldsymbol{i})}{9}$$

$$\text{cFactor}(x^2+3) \qquad x^2+3$$

$$\text{cFactor}(x^2+a) \qquad x^2+a$$

cFactor()

cFactor(*Expr1*,*Var***)** returns *Expr1* factored with respect to variable *Var*.

Expr1 is factored as much as possible toward factors that are linear in *Var*, with perhaps non-real constants, even if it introduces irrational constants or subexpressions that are irrational in other variables.

The factors and their terms are sorted with *Var* as the main variable. Similar powers of *Var* are collected in each factor. Include *Var* if factorization is needed with respect to only that variable and you are willing to accept irrational expressions in any other variables to increase factorization with respect to *Var*. There might be some incidental factoring with respect to other variables.

For the Auto setting of the **Auto or Approximate** mode, including *Var* also permits approximation with floating-point coefficients where irrational coefficients cannot be explicitly expressed concisely in terms of the built-in functions. Even when there is only one variable, including *Var* might yield more complete factorization.

Note: See also **factor()**.

$$\text{cFactor}\left(a^3 \cdot x^2 + a \cdot x^2 + a^3 + a, x\right)$$
$$a \cdot \left(a^2 + 1\right) \cdot (x - \boldsymbol{i}) \cdot (x + \boldsymbol{i})$$

$$\text{cFactor}\left(x^2 + 3, x\right) \qquad \left(x + \sqrt{3} \cdot \boldsymbol{i}\right) \cdot \left(x - \sqrt{3} \cdot \boldsymbol{i}\right)$$

$$\text{cFactor}\left(x^2 + a, x\right) \qquad \left(x + \sqrt{a} \cdot -\boldsymbol{i}\right) \cdot \left(x + \sqrt{a} \cdot \boldsymbol{i}\right)$$

$$\text{cFactor}\left(x^5 + 4 \cdot x^4 + 5 \cdot x^3 - 6 \cdot x - 3\right)$$
$$x^5 + 4 \cdot x^4 + 5 \cdot x^3 - 6 \cdot x - 3$$

$$\text{cFactor}\left(x^5 + 4 \cdot x^4 + 5 \cdot x^3 - 6 \cdot x - 3, x\right)$$
$$(x - 0.964673) \cdot (x + 0.611649) \cdot (x + 2.12543) \cdot (x \blacktriangleright$$

To see the entire result,
press ▲ and then use ◄ and ► to move the cursor.

char()

char(*Integer***)** ⇒ *character*

Returns a character string containing the character numbered *Integer* from the handheld character set. The valid range for *Integer* is 0–65535.

char(38)	"&"
char(65)	"A"

charPoly()

charPoly(*squareMatrix,Var***)** ⇒
polynomial expression

charPoly(*squareMatrix,Expr***)** ⇒
polynomial expression

charPoly(*squareMatrix1,Matrix2***)** ⇒
polynomial expression

Returns the characteristic polynomial of
squareMatrix. The characteristic
polynomial of $n{\times}n$ matrix A, denoted by p_A
(λ), is the polynomial defined by

$$p_A(\lambda) = \det(\lambda{\bullet}I{-}A)$$

where I denotes the $n{\times}n$ identity matrix.

squareMatrix1 and *squareMatrix2* must
have the equal dimensions.

$m:=\begin{bmatrix}1 & 3 & 0\\2 & -1 & 0\\-2 & 2 & 5\end{bmatrix}$	$\begin{bmatrix}1 & 3 & 0\\2 & -1 & 0\\-2 & 2 & 5\end{bmatrix}$
charPoly(m,x)	$-x^3+5{\cdot}x^2+7{\cdot}x-35$
charPoly(m,x^2+1)	$-x^6+2{\cdot}x^4+14{\cdot}x^2-24$
charPoly(m,m)	0

χ²2way

χ**²2way** *obsMatrix*

chi22way *obsMatrix*

Computes a χ^2 test for association on the
two-way table of counts in the observed
matrix *obsMatrix*. A summary of results is
stored in the *stat.results* variable. (page
176)

For information on the effect of empty
elements in a matrix, see "Empty (Void)
Elements," page 251.

Output variable	Description
stat.χ^2	Chi square stat: sum (observed - expected)^2/expected
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.df	Degrees of freedom for the chi square statistics
stat.ExpMat	Matrix of expected elemental count table, assuming null hypothesis
stat.CompMat	Matrix of elemental chi square statistic contributions

χ^2Cdf()

χ^2**Cdf(***lowBound*,*upBound*,*df***)** ⇒ *number* if *lowBound* and *upBound* are numbers, *list* if *lowBound* and *upBound* are lists

chi2Cdf(*lowBound*,*upBound*,*df***)** ⇒ *number* if *lowBound* and *upBound* are numbers, *list* if *lowBound* and *upBound* are lists

Computes the χ^2 distribution probability between *lowBound* and *upBound* for the specified degrees of freedom *df*.

For P($X \leq upBound$), set *lowBound* = 0.

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

χ^2GOF

χ^2**GOF** *obsList*,*expList*,*df*

chi2GOF *obsList*,*expList*,*df*

Performs a test to confirm that sample data is from a population that conforms to a specified distribution. *obsList* is a list of counts and must contain integers. A summary of results is stored in the *stat.results* variable. (See page 176.)

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.χ^2	Chi square stat: sum((observed - expected)^2/expected
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.df	Degrees of freedom for the chi square statistics
stat.CompList	Elemental chi square statistic contributions

χ^2Pdf()

χ^2**Pdf(***XVal*,*df***)** ⇒ *number* if *XVal* is a number, *list* if *XVal* is a list

χ^2**Pdf()**

chi2Pdf(*XVal***,***df***)** ⇒ *number* if *XVal* is a
number, *list* if *XVal* is a list

Computes the probability density function
(pdf) for the χ^2 distribution at a specified
XVal value for the specified degrees of
freedom *df*.

For information on the effect of empty
elements in a list, see "Empty (Void)
Elements," page 251.

ClearAZ

ClearAZ

Clears all single-character variables in the
current problem space.

If one or more of the variables are locked,
this command displays an error message
and deletes only the unlocked variables. See
unLock, page 197.

$5 \rightarrow b$	5
b	5
ClearAZ	*Done*
b	b

ClrErr

ClrErr

Clears the error status and sets system
variable *errCode* to zero.

The **Else** clause of the **Try...Else...EndTry**
block should use **ClrErr** or **PassErr**. If the
error is to be processed or ignored, use
ClrErr. If what to do with the error is not
known, use **PassErr** to send it to the next
error handler. If there are no more pending
Try...Else...EndTry error handlers, the error
dialog box will be displayed as normal.

Note: See also **PassErr**, page 131, and **Try**,
page 191.

Note for entering the example: For
instructions on entering multi-line program
and function definitions, refer to the
Calculator section of your product guidebook.

For an example of **ClrErr**, See Example 2
under the **Try** command, page 191.

colAugment() Catalog >

colAugment(_Matrix1_**,** _Matrix2_**)** ⇒ _matrix_

Returns a new matrix that is _Matrix2_ appended to _Matrix1_. The matrices must have equal column dimensions, and _Matrix2_ is appended to _Matrix1_ as new rows. Does not alter _Matrix1_ or _Matrix2_.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \rightarrow m1 \qquad \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$$

$$\begin{bmatrix} 5 & 6 \end{bmatrix} \rightarrow m2 \qquad \begin{bmatrix} 5 & 6 \end{bmatrix}$$

$$\text{colAugment}(m1,m2) \qquad \begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix}$$

colDim() Catalog >

colDim(_Matrix_**)** ⇒ _expression_

Returns the number of columns contained in _Matrix_.

Note: See also **rowDim()**.

$$\text{colDim}\left(\begin{bmatrix} 0 & 1 & 2 \\ 3 & 4 & 5 \end{bmatrix}\right) \qquad 3$$

colNorm() Catalog >

colNorm(_Matrix_**)** ⇒ _expression_

Returns the maximum of the sums of the absolute values of the elements in the columns in _Matrix_.

Note: Undefined matrix elements are not allowed. See also **rowNorm()**.

$$\begin{bmatrix} 1 & -2 & 3 \\ 4 & 5 & -6 \end{bmatrix} \rightarrow mat \qquad \begin{bmatrix} 1 & -2 & 3 \\ 4 & 5 & -6 \end{bmatrix}$$

$$\text{colNorm}(mat) \qquad 9$$

comDenom() Catalog >

comDenom(_Expr1_[,_Var_]**)** ⇒ _expression_
comDenom(_List1_[,_Var_]**)** ⇒ _list_
comDenom(_Matrix1_[,_Var_]**)** ⇒ _matrix_

comDenom(_Expr1_**)** returns a reduced ratio of a fully expanded numerator over a fully expanded denominator.

$$\text{comDenom}\left(\frac{y^2+y}{(x+1)^2}+y^2+y\right)$$

$$\frac{x^2 \cdot y^2+x^2 \cdot y+2 \cdot x \cdot y^2+2 \cdot x \cdot y+2 \cdot y^2+2 \cdot y}{x^2+2 \cdot x+1}$$

comDenom()

comDenom($Expr1$,Var**)** returns a reduced ratio of numerator and denominator expanded with respect to Var. The terms and their factors are sorted with Var as the main variable. Similar powers of Var are collected. There might be some incidental factoring of the collected coefficients. Compared to omitting Var, this often saves time, memory, and screen space, while making the expression more comprehensible. It also makes subsequent operations on the result faster and less likely to exhaust memory.

If Var does not occur in $Expr1$, **comDenom** (**$Expr1$,Var**) returns a reduced ratio of an unexpanded numerator over an unexpanded denominator. Such results usually save even more time, memory, and screen space. Such partially factored results also make subsequent operations on the result much faster and much less likely to exhaust memory.

Even when there is no denominator, the **comden** function is often a fast way to achieve partial factorization if **factor()** is too slow or if it exhausts memory.

Hint: Enter this **comden()** function definition and routinely try it as an alternative to **comDenom()** and **factor()**.

$$\text{comDenom}\left(\frac{y^2+y}{(x+1)^2}+y^2+y,x\right)$$

$$\frac{x^2 \cdot y \cdot (y+1) + 2 \cdot x \cdot y \cdot (y+1) + 2 \cdot y \cdot (y+1)}{x^2 + 2 \cdot x + 1}$$

$$\text{comDenom}\left(\frac{y^2+y}{(x+1)^2}+y^2+y,y\right)$$

$$\frac{y^2 \cdot (x^2 + 2 \cdot x + 2) + y \cdot (x^2 + 2 \cdot x + 2)}{x^2 + 2 \cdot x + 1}$$

$$\text{Define } comden(exprn) = \text{comDenom}(exprn, abc)$$
$$\qquad\qquad\qquad\qquad\qquad Done$$

$$comden\left(\frac{y^2+y}{(x+1)^2}+y^2+y\right) \quad \frac{(x^2+2\cdot x+2)\cdot y\cdot (y+1)}{(x+1)^2}$$

$$comden\left(1234\cdot x^2 \cdot (y^3-y) + 2468\cdot x\cdot (y^2-1)\right)$$
$$1234\cdot x\cdot (x\cdot y+2)\cdot (y^2-1)$$

completeSquare ()

completeSquare($ExprOrEqn$**, Var) ⇒**
expression or equation

completeSquare($ExprOrEqn$**, $Var^\wedge Power$**)
⇒** *expression or equation*

completeSquare($ExprOrEqn$**, $Var1$, $Var2$
[,...]) ⇒** *expression or equation*

completeSquare($ExprOrEqn$**, {$Var1$, $Var2$
[,...]}) ⇒** *expression or equation*

Converts a quadratic polynomial expression of the form a•x^2+b•x+c into the form a•(x-h)^2+k

$$\text{completeSquare}(x^2+2\cdot x+3,x) \qquad (x+1)^2+2$$

$$\text{completeSquare}(x^2+2\cdot x=3,x) \qquad (x+1)^2=4$$

$$\text{completeSquare}(x^6+2\cdot x^3+3,x^3) \qquad (x^3+1)^2+2$$

$$\text{completeSquare}(x^2+4\cdot x+y^2+6\cdot y+3=0,x,y)$$
$$(x+2)^2+(y+3)^2=10$$

completeSquare ()

- or -

Converts a quadratic equation of the form a•x^2+b•x+c=d into the form a•(x-h)^2=k

The first argument must be a quadratic expression or equation in standard form with respect to the second argument.

The Second argument must be a single univariate term or a single univariate term raised to a rational power, for example x, y^2, or $z^{(1/3)}$.

The third and fourth syntax attempt to complete the square with respect to variables $Var1$, $Var2$ [,…]).

$$\text{completeSquare}\left(3\cdot x^2+2\cdot y+7\cdot y^2+4\cdot x=3,\{x,y\}\right)$$
$$3\cdot\left(x+\frac{2}{3}\right)^2+7\cdot\left(y+\frac{1}{7}\right)^2=\frac{94}{21}$$

$$\text{completeSquare}\left(x^2+2\cdot x\cdot y,x,y\right) \qquad (x+y)^2-y^2$$

conj()

conj($Expr1$**)** ⇒ *expression*

conj($List1$**)** ⇒ *list*

conj($Matrix1$**)** ⇒ *matrix*

Returns the complex conjugate of the argument.

Note: All undefined variables are treated as real variables.

$$\text{conj}(1+2\cdot i) \qquad 1-2\cdot i$$
$$\text{conj}\left(\begin{bmatrix}2 & 1-3\cdot i \\ -i & -7\end{bmatrix}\right) \qquad \begin{bmatrix}2 & 1+3\cdot i \\ i & -7\end{bmatrix}$$
$$\text{conj}(z) \qquad z$$
$$\text{conj}(x+i\cdot y) \qquad x-y\cdot i$$

constructMat()

constructMat
($Expr$**,**$Var1$**,**$Var2$**,**$numRows$**,**$numCols$**)** ⇒ *matrix*

Returns a matrix based on the arguments.

$Expr$ is an expression in variables $Var1$ and $Var2$. Elements in the resulting matrix are formed by evaluating $Expr$ for each incremented value of $Var1$ and $Var2$.

$Var1$ is automatically incremented from **1** through $numRows$. Within each row, $Var2$ is incremented from **1** through $numCols$.

$$\text{constructMat}\left(\frac{1}{i+j},i,j,3,4\right) \quad \begin{bmatrix}\frac{1}{2} & \frac{1}{3} & \frac{1}{4} & \frac{1}{5} \\ \frac{1}{3} & \frac{1}{4} & \frac{1}{5} & \frac{1}{6} \\ \frac{1}{4} & \frac{1}{5} & \frac{1}{6} & \frac{1}{7}\end{bmatrix}$$

CopyVar

CopyVar *Var1*, *Var2*

CopyVar *Var1***.**, *Var2***.**

CopyVar *Var1*, *Var2* copies the value of
variable *Var1* to variable *Var2*, creating
Var2 if necessary. Variable *Var1* must have
a value.

Define $a(x) = \dfrac{1}{x}$	*Done*
Define $b(x) = x^2$	*Done*
CopyVar a,c: $c(4)$	$\dfrac{1}{4}$
CopyVar b,c: $c(4)$	16

If *Var1* is the name of an existing user-
defined function, copies the definition of
that function to function *Var2*. Function
Var1 must be defined.

Var1 must meet the variable-naming
requirements or must be an indirection
expression that simplifies to a variable
name meeting the requirements.

CopyVar *Var1***.**, *Var2***.** copies all members
of the *Var1*. variable group to the *Var2*.
group, creating *Var2*. if necessary.

$aa.a := 45$	45
$aa.b := 6.78$	6.78
CopyVar $aa., bb.$	*Done*
getVarInfo()	$\begin{bmatrix} aa.a & \text{"NUM"} & \text{"}\square\text{"} & 0 \\ aa.b & \text{"NUM"} & \text{"}\square\text{"} & 0 \\ bb.a & \text{"NUM"} & \text{"}\square\text{"} & 0 \\ bb.b & \text{"NUM"} & \text{"}\square\text{"} & 0 \end{bmatrix}$

Var1. must be the name of an existing
variable group, such as the statistics *stat.nn*
results, or variables created using the
LibShortcut() function. If *Var2*. already
exists, this command replaces all members
that are common to both groups and adds
the members that do not already exist. If
one or more members of *Var2*. are locked,
all members of *Var2*. are left unchanged.

corrMat()

corrMat(*List1***,***List2*[**,**…[**,***List20*]]**)**

Computes the correlation matrix for the
augmented matrix [*List1, List2, ..., List20*].

►cos

Expr ►**cos**

Note: You can insert this operator from the
computer keyboard by typing @**>cos**.

Represents *Expr* in terms of cosine. This is
a display conversion operator. It can be
used only at the end of the entry line.

$(\sin(x))^2 \blacktriangleright \cos$	$1 - (\cos(x))^2$

▶**cos** reduces all powers of
sin(...) modulo 1−cos(...)^2
so that any remaining powers of cos(...)
have exponents in the range (0, 2). Thus,
the result will be free of sin(...) if and only
if sin(...) occurs in the given expression only
to even powers.

Note: This conversion operator is not
supported in Degree or Gradian Angle
modes. Before using it, make sure that the
Angle mode is set to Radians and that *Expr*
does not contain explicit references to
degree or gradian angles.

---

cos()   [trig] key

cos($Expr1$**)** ⇒ *expression*

cos($List1$**)** ⇒ *list*

cos($Expr1$**)** returns the cosine of the
argument as an expression.

cos($List1$**)** returns a list of the cosines of all
elements in $List1$.

Note: The argument is interpreted as a
degree, gradian or radian angle, according
to the current angle mode setting. You can
use °, ^{G}, or ^{r} to override the angle mode
temporarily.

In Degree angle mode:

$$\cos\left(\frac{\pi}{4}^r\right) \qquad \frac{\sqrt{2}}{2}$$

$$\cos(45) \qquad \frac{\sqrt{2}}{2}$$

$$\cos(\{0,60,90\}) \qquad \left\{1,\frac{1}{2},0\right\}$$

In Gradian angle mode:

$$\cos(\{0,50,100\}) \qquad \left\{1,\frac{\sqrt{2}}{2},0\right\}$$

In Radian angle mode:

$$\cos\left(\frac{\pi}{4}\right) \qquad \frac{\sqrt{2}}{2}$$

$$\cos(45°) \qquad \frac{\sqrt{2}}{2}$$

cos($squareMatrix1$**)** ⇒ *squareMatrix*

Returns the matrix cosine of
$squareMatrix1$. This is not the same as
calculating the cosine of each element.

In Radian angle mode:

---

cos()
trig **key**

When a scalar function f(A) operates on
squareMatrix1 (A), the result is calculated
by the algorithm:

Compute the eigenvalues (λ_i) and
eigenvectors (V_i) of A.

squareMatrix1 must be diagonalizable.
Also, it cannot have symbolic variables that
have not been assigned a value.

Form the matrices:

$$B = \begin{bmatrix} \lambda_1 & 0 & \dots & 0 \\ 0 & \lambda_2 & \dots & 0 \\ 0 & 0 & \dots & 0 \\ 0 & 0 & \dots & \lambda_n \end{bmatrix} \text{ and } X = [V_1, V_2, \dots, V_n]$$

Then A = X B X^{-1} and f(A) = X f(B) X^{-1}. For
example, cos(A) = X cos(B) X^{-1} where:

cos(B) =

$$\begin{bmatrix} \cos(\lambda_1) & 0 & \dots & 0 \\ 0 & \cos(\lambda_2) & \dots & 0 \\ 0 & 0 & \dots & 0 \\ 0 & 0 & \dots & \cos(\lambda_n) \end{bmatrix}$$

All computations are performed using
floating-point arithmetic.

$$\cos\left(\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}\right)$$
$$\begin{bmatrix} 0.212493 & 0.205064 & 0.121389 \\ 0.160871 & 0.259042 & 0.037126 \\ 0.248079 & -0.090153 & 0.218972 \end{bmatrix}$$

cos⁻¹()
trig **key**

cos⁻¹(*Expr1***)** ⇒ *expression*

cos⁻¹(*List1***)** ⇒ *list*

cos⁻¹(*Expr1***)** returns the angle whose
cosine is *Expr1* as an expression.

cos⁻¹(*List1***)** returns a list of the inverse
cosines of each element of *List1*.

Note: The result is returned as a degree,
gradian or radian angle, according to the
current angle mode setting.

Note: You can insert this function from the
keyboard by typing **arccos(**...**)**.

In Degree angle mode:

$\cos^{-1}(1)$ 0

In Gradian angle mode:

$\cos^{-1}(0)$ 100

In Radian angle mode:

$\cos^{-1}(\{0, 0.2, 0.5\})$ $\left\{\dfrac{\pi}{2}, 1.36944, 1.0472\right\}$

cosh⁻¹()

cosh⁻¹(_List1_**)** returns a list of the inverse hyperbolic cosines of each element of _List1_.

Note: You can insert this function from the keyboard by typing **arccosh(**...**)**.

cosh⁻¹(_squareMatrix1_**)** ⇒ _squareMatrix_

Returns the matrix inverse hyperbolic cosine of _squareMatrix1_. This is not the same as calculating the inverse hyperbolic cosine of each element. For information about the calculation method, refer to **cos ()**.

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

In Radian angle mode and In Rectangular Complex Format:

$$\cosh^{-1}\left(\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}\right)$$

$$\begin{bmatrix} 2.52503+1.73485 \cdot i & -0.009241-1.4908 \\ 0.486969-0.725533 \cdot i & 1.66262+0.623491▸ \\ -0.322354-2.08316 \cdot i & 1.26707+1.79018 \end{bmatrix}$$

To see the entire result,
press ▲ and then use ◄ and ► to move the cursor.

cot()

cot(_Expr1_**)** ⇒ _expression_

cot(_List1_**)** ⇒ _list_

Returns the cotangent of _Expr1_ or returns a list of the cotangents of all elements in _List1_.

Note: The argument is interpreted as a degree, gradian or radian angle, according to the current angle mode setting. You can use °, ᴳ, or ʳ to override the angle mode temporarily.

In Degree angle mode:

$$\cot(45) \qquad\qquad\qquad 1$$

In Gradian angle mode:

$$\cot(50) \qquad\qquad\qquad 1$$

In Radian angle mode:

$$\cot(\{1,2.1,3\}) \quad \left\{\frac{1}{\tan(1)}, -0.584848, \frac{1}{\tan(3)}\right\}$$

cot⁻¹()

cot⁻¹(_Expr1_**)** ⇒ _expression_

cot⁻¹(_List1_**)** ⇒ _list_

Returns the angle whose cotangent is _Expr1_ or returns a list containing the inverse cotangents of each element of _List1_.

In Degree angle mode:

$$\cot^{-1}(1) \qquad\qquad\qquad 45.$$

In Gradian angle mode:

$$\cot^{-1}(1) \qquad\qquad\qquad 50.$$

cot⁻¹()

Note: The result is returned as a degree, gradian or radian angle, according to the current angle mode setting.

Note: You can insert this function from the keyboard by typing **arccot(...)**.

In Radian angle mode:

$$\cot^{-1}(1) \qquad \frac{\pi}{4}$$

coth()

Catalog > 📖

coth(*Expr1***)** ⇒ *expression*

coth(*List1***)** ⇒ *list*

Returns the hyperbolic cotangent of *Expr1* or returns a list of the hyperbolic cotangents of all elements of *List1*.

$$\coth(1.2) \qquad 1.19954$$
$$\coth(\{1,3.2\}) \qquad \left\{\frac{1}{\tanh(1)}, 1.00333\right\}$$

coth⁻¹()

Catalog > 📖

coth⁻¹(*Expr1***)** ⇒ *expression*

coth⁻¹(*List1***)** ⇒ *list*

Returns the inverse hyperbolic cotangent of *Expr1* or returns a list containing the inverse hyperbolic cotangents of each element of *List1*.

Note: You can insert this function from the keyboard by typing **arccoth(...)**.

$$\coth^{-1}(3.5) \qquad 0.293893$$
$$\coth^{-1}(\{-2,2.1,6\})$$
$$\left\{\frac{-\ln(3)}{2}, 0.518046, \frac{\ln\left(\frac{7}{5}\right)}{2}\right\}$$

count()

Catalog > 📖

count(*Value1orList1* [,*Value2orList2* [,...]]**)** ⇒ *value*

Returns the accumulated count of all elements in the arguments that evaluate to numeric values.

Each argument can be an expression, value, list, or matrix. You can mix data types and use arguments of various dimensions.

For a list, matrix, or range of cells, each element is evaluated to determine if it should be included in the count.

$$\text{count}(2,4,6) \qquad 3$$
$$\text{count}(\{2,4,6\}) \qquad 3$$
$$\text{count}\left(2,\{4,6\},\begin{bmatrix} 8 & 10 \\ 12 & 14 \end{bmatrix}\right) \qquad 7$$
$$\text{count}\left(\frac{1}{2},3+4\cdot\boldsymbol{i},\text{undef},\text{"hello"},x+5.,\text{sign}(0)\right)$$
$$2$$

In the last example, only 1/2 and 3+4*$\boldsymbol{i}$ are counted. The remaining arguments, assuming x is undefined, do not evaluate to numeric values.

Within the Lists & Spreadsheet application, you can use a range of cells in place of any argument.

Empty (void) elements are ignored. For more information on empty elements, see page 251.

countif($List$,$Criteria$**)** $\Rightarrow$ *value*

Returns the accumulated count of all elements in $List$ that meet the specified *Criteria*.

Criteria can be:

- A value, expression, or string. For example, **3** counts only those elements in $List$ that simplify to the value 3.
- A Boolean expression containing the symbol **?** as a placeholder for each element. For example, **?<5** counts only those elements in $List$ that are less than 5.

Within the Lists & Spreadsheet application, you can use a range of cells in place of $List$.

Empty (void) elements in the list are ignored. For more information on empty elements, see page 251.

Note: See also **sumIf()**, page 180, and **frequency()**, page 74.

$$\text{countIf}\left(\{1,3,"abc",\text{undef},3,1\},3\right) \qquad 2$$

Counts the number of elements equal to 3.

$$\text{countIf}\left(\{"abc","def","abc",3\},"def"\right) \qquad 1$$

Counts the number of elements equal to "def."

$$\text{countIf}\left(\{x^{-2},x^{-1},1,x,x^2\},x\right) \qquad 1$$

Counts the number of elements equal to x; this example assumes the variable x is undefined.

$$\text{countIf}\left(\{1,3,5,7,9\},?<5\right) \qquad 2$$

Counts 1 and 3.

$$\text{countIf}\left(\{1,3,5,7,9\},2<?<8\right) \qquad 3$$

Counts 3, 5, and 7.

$$\text{countIf}\left(\{1,3,5,7,9\},?<4 \text{ or } ?>6\right) \qquad 4$$

Counts 1, 3, 7, and 9.

cPolyRoots()

cPolyRoots($Poly$**,**Var**)** $\Rightarrow$ *list*

cPolyRoots($ListOfCoeffs$**)** $\Rightarrow$ *list*

The first syntax, **cPolyRoots(**$Poly$**,**Var**)**, returns a list of complex roots of polynomial *Poly* with respect to variable *Var*.

Poly must be a polynomial in one variable.

The second syntax, **cPolyRoots** **(**$ListOfCoeffs$**)**, returns a list of complex roots for the coefficients in *ListOfCoeffs*.

Note: See also **polyRoots()**, page 136.

$\text{polyRoots}\left(y^3+1,y\right)$	$\{-1\}$
$\text{cPolyRoots}\left(y^3+1,y\right)$	
$\left\{-1, \dfrac{1}{2}-\dfrac{\sqrt{3}}{2}\cdot i, \dfrac{1}{2}+\dfrac{\sqrt{3}}{2}\cdot i\right\}$	
$\text{polyRoots}\left(x^2+2\cdot x+1,x\right)$	$\{-1,-1\}$
$\text{cPolyRoots}\left(\{1,2,1\}\right)$	$\{-1,-1\}$

crossP()

crossP($List1$**,** $List2$**)** $\Rightarrow$ *list*

Returns the cross product of *List1* and *List2* as a list.

List1 and *List2* must have equal dimension, and the dimension must be either 2 or 3.

crossP($Vector1$**,** $Vector2$**)** $\Rightarrow$ *vector*

Returns a row or column vector (depending on the arguments) that is the cross product of *Vector1* and *Vector2*.

Both *Vector1* and *Vector2* must be row vectors, or both must be column vectors. Both vectors must have equal dimension, and the dimension must be either 2 or 3.

$\text{crossP}\left(\{a1,b1\},\{a2,b2\}\right)$	
	$\{0,0,a1\cdot b2 - a2\cdot b1\}$
$\text{crossP}\left(\{0.1,2.2,\text{-}5\},\{1,\text{-}0.5,0\}\right)$	
	$\{\text{-}2.5,\text{-}5.,\text{-}2.25\}$

$\text{crossP}\left(\begin{bmatrix} 1 & 2 & 3 \end{bmatrix},\begin{bmatrix} 4 & 5 & 6 \end{bmatrix}\right)$	$\begin{bmatrix} \text{-}3 & 6 & \text{-}3 \end{bmatrix}$
$\text{crossP}\left(\begin{bmatrix} 1 & 2 \end{bmatrix},\begin{bmatrix} 3 & 4 \end{bmatrix}\right)$	$\begin{bmatrix} 0 & 0 & \text{-}2 \end{bmatrix}$

csc()

csc($Expr1$**)** $\Rightarrow$ *expression*

csc($List1$**)** $\Rightarrow$ *list*

Returns the cosecant of *Expr1* or returns a list containing the cosecants of all elements in *List1*.

In Degree angle mode:

$\csc(45)$	$\sqrt{2}$

In Gradian angle mode:

$\csc(50)$	$\sqrt{2}$

In Radian angle mode:

$$\csc\left(\left\{1,\frac{\pi}{2},\frac{\pi}{3}\right\}\right) \qquad \left\{\frac{1}{\sin(1)},1,\frac{2\cdot\sqrt{3}}{3}\right\}$$

csc⁻¹($Expr1$**)** ⇒ *expression*

csc⁻¹($List1$**)** ⇒ *list*

Returns the angle whose cosecant is $Expr1$ or returns a list containing the inverse cosecants of each element of $List1$.

Note: The result is returned as a degree, gradian or radian angle, according to the current angle mode setting.

Note: You can insert this function from the keyboard by typing **arccsc(...)**.

In Degree angle mode:

$$\csc^{-1}(1) \qquad\qquad 90.$$

In Gradian angle mode:

$$\csc^{-1}(1) \qquad\qquad 100.$$

In Radian angle mode:

$$\csc^{-1}\left(\left\{1,4,6\right\}\right) \qquad \left\{\frac{\pi}{2},\sin^{-1}\left(\frac{1}{4}\right),\sin^{-1}\left(\frac{1}{6}\right)\right\}$$

csch($Expr1$**)** ⇒ *expression*

csch($List1$**)** ⇒ *list*

Returns the hyperbolic cosecant of $Expr1$ or returns a list of the hyperbolic cosecants of all elements of $List1$.

$$\text{csch}(3) \qquad\qquad \frac{1}{\sinh(3)}$$

$$\text{csch}(\left\{1,2.1,4\right\})$$
$$\left\{\frac{1}{\sinh(1)},0.248641,\frac{1}{\sinh(4)}\right\}$$

csch⁻¹($Expr1$**)** ⇒ *expression*

csch⁻¹($List1$**)** ⇒ *list*

Returns the inverse hyperbolic cosecant of $Expr1$ or returns a list containing the inverse hyperbolic cosecants of each element of $List1$.

Note: You can insert this function from the keyboard by typing **arccsch(...)**.

$$\text{csch}^{-1}(1) \qquad\qquad \sinh^{-1}(1)$$

$$\text{csch}^{-1}(\left\{1,2.1,3\right\})$$
$$\left\{\sinh^{-1}(1),0.459815,\sinh^{-1}\left(\frac{1}{3}\right)\right\}$$

cSolve(_Equation_**,** _Var_**)** ⇒ _Boolean expression_

cSolve(_Equation_**,** _Var=Guess_**)** ⇒ _Boolean expression_

cSolve(_Inequality_**,** _Var_**)** ⇒ _Boolean expression_

$$\text{cSolve}\left(x^3=-1,x\right)$$
$$x=\frac{1}{2}+\frac{\sqrt{3}}{2}\cdot i \text{ or } x=\frac{1}{2}-\frac{\sqrt{3}}{2}\cdot i \text{ or } x=-1$$

$$\text{solve}\left(x^3=-1,x\right) \qquad\qquad x=-1$$

Returns candidate complex solutions of an equation or inequality for _Var_. The goal is to produce candidates for all real and non-real solutions. Even if _Equation_ is real, **cSolve()** allows non-real results in Real result Complex Format.

Although all undefined variables that do not end with an underscore (_) are processed as if they were real, **cSolve()** can solve polynomial equations for complex solutions.

cSolve() temporarily sets the domain to complex during the solution even if the current domain is real. In the complex domain, fractional powers having odd denominators use the principal rather than the real branch. Consequently, solutions from **solve()** to equations involving such fractional powers are not necessarily a subset of those from **cSolve()**.

$$\text{cSolve}\left(x^{\frac{1}{3}}=-1,x\right) \qquad\qquad \text{false}$$

$$\text{solve}\left(x^{\frac{1}{3}}=-1,x\right) \qquad\qquad x=-1$$

cSolve() starts with exact symbolic methods. **cSolve()** also uses iterative approximate complex polynomial factoring, if necessary.

In Display Digits mode of Fix 2:

$$\text{exact}\left(\text{cSolve}\left(x^5+4\cdot x^4+5\cdot x^3-6\cdot x-3=0,x\right)\right)$$
$$x\cdot\left(x^4+4\cdot x^3+5\cdot x^2-6\right)=3$$

Note: See also **cZeros()**, **solve()**, and **zeros()**.

$$\text{cSolve}(Ans,x)$$
$$x=-1.11+1.07\cdot i \text{ or } x=-1.11-1.07\cdot i \text{ or } x=-2.\text{⟩}$$

To see the entire result,
press ▲ and then use ◀ and ▶ to move the cursor.

cSolve(_Eqn1_**and**_Eqn2_ [**and...**]**,**
VarOrGuess1**,** _VarOrGuess2_ [**,** **...**]**)** ⇒
Boolean expression

cSolve(*SystemOfEqns***,** *VarOrGuess1***,**
VarOrGuess2 [**,** **...**]**)** ⇒
Boolean expression

Returns candidate complex solutions to the
simultaneous algebraic equations, where
each *varOrGuess* specifies a variable that
you want to solve for.

Optionally, you can specify an initial guess
for a variable. Each *varOrGuess* must have
the form:

variable
– or –
variable = real or non-real number

For example, x is valid and so is x=3+i.

If all of the equations are polynomials and
if you do NOT specify any initial guesses,
cSolve() uses the lexical
Gröbner/Buchberger elimination method to
attempt to determine **all** complex solutions.

Complex solutions can include both real and
non-real solutions, as in the example to the
right.

$$\text{cSolve}\left(u\cdot v-u=v \text{ and } v^2=-u, \{u,v\}\right)$$
$$u=\frac{1}{2}+\frac{\sqrt{3}}{2}\cdot i \text{ and } v=-\frac{1}{2}-\frac{\sqrt{3}}{2}\cdot i \text{ or } u=\frac{1}{2}-\frac{\sqrt{3}}{2} \blacktriangleright$$

To see the entire result,
press ▲ and then use ◄ and ► to move the
cursor.

Simultaneous polynomial equations can
have extra variables that have no values,
but represent given numeric values that
could be substituted later.

$$\text{cSolve}\left(u\cdot v-u=c\cdot v \text{ and } v^2=-u, \{u,v\}\right)$$
$$u=\frac{-\left(\sqrt{4\cdot c-1}\cdot i+1\right)^2}{4} \text{ and } v=\frac{\sqrt{4\cdot c-1}\cdot i+1}{2} \text{ o}\blacktriangleright$$

To see the entire result,
press ▲ and then use ◄ and ► to move the
cursor.

You can also include solution variables that
do not appear in the equations. These
solutions show how families of solutions
might contain arbitrary constants of the
form **c***k*, where *k* is an integer suffix from 1
through 255.

$$\text{cSolve}\left(u\cdot v-u=v \text{ and } v^2=-u, \{u,v,w\}\right)$$
$$u=\frac{1}{2}+\frac{\sqrt{3}}{2}\cdot i \text{ and } v=-\frac{1}{2}-\frac{\sqrt{3}}{2}\cdot i \text{ and } w=\textbf{c43} \text{ or}\blacktriangleright$$

For polynomial systems, computation time or memory exhaustion may depend strongly on the order in which you list solution variables. If your initial choice exhausts memory or your patience, try rearranging the variables in the equations and/or *varOrGuess* list.

To see the entire result,
press ▲ and then use ◄ and ► to move the cursor.

If you do not include any guesses and if any equation is non-polynomial in any variable but all equations are linear in all solution variables, **cSolve()** uses Gaussian elimination to attempt to determine all solutions.

$$\text{cSolve}\left(u+v=e^{W} \text{ and } u-v=i, \{u,v\}\right)$$
$$u=\frac{e^{W}+i}{2} \text{ and } v=\frac{e^{W}-i}{2}$$

If a system is neither polynomial in all of its variables nor linear in its solution variables, **cSolve()** determines at most one solution using an approximate iterative method. To do so, the number of solution variables must equal the number of equations, and all other variables in the equations must simplify to numbers.

$$\text{cSolve}\left(e^{z}=w \text{ and } w=z^{2}, \{w,z\}\right)$$
$$w=0.494866 \text{ and } z=0.703467$$

A non-real guess is often necessary to determine a non-real solution. For convergence, a guess might have to be rather close to a solution.

$$\text{cSolve}\left(e^{z}=w \text{ and } w=z^{2}, \{w,z=1+i\}\right)$$
$$w=0.149606+4.8919\cdot i \text{ and } z=1.58805+1.5402\rangle$$

To see the entire result,
press ▲ and then use ◄ and ► to move the cursor.

CubicReg   **Catalog > 📖**

CubicReg *X*, *Y*[, [*Freq*] [, *Category*, *Include*]]

Computes the cubic polynomial regression $y=a\cdot x^3+b\cdot x^2+c\cdot x+d$ on lists *X* and *Y* with frequency *Freq*. A summary of results is stored in the *stat.results* variable. (See page 176.)

All the lists must have equal dimension except for *Include*.

X and *Y* are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding X and Y data point. The default value is 1. All elements must be integers ≥ 0.

Category is a list of category codes for the corresponding X and Y data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.RegEqn	Regression equation: $a{\cdot}x^3+b{\cdot}x^2+c{\cdot}x+d$
stat.a, stat.b, stat.c, stat.d	Regression coefficients
stat.R^2	Coefficient of determination
stat.Resid	Residuals from the regression
stat.XReg	List of data points in the modified *X List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.YReg	List of data points in the modified *Y List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.FreqReg	List of frequencies corresponding to *stat.XReg* and *stat.YReg*

---

cumulativeSum()   **Catalog >** 📖

cumulativeSum(*List1***)** $\Rightarrow$ *list*

Returns a list of the cumulative sums of the elements in *List1*, starting at element 1.

$\text{cumulativeSum}(\{1,2,3,4\})$ $\{1,3,6,10\}$

cumulativeSum()

cumulativeSum(*Matrix1***)** ⇒ *matrix*

Returns a matrix of the cumulative sums of the elements in *Matrix1*. Each element is the cumulative sum of the column from top to bottom.

An empty (void) element in *List1* or *Matrix1* produces a void element in the resulting list or matrix. For more information on empty elements, see page 251.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix} \to m1 \qquad \begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix}$$

$$\text{cumulativeSum}(m1) \qquad \begin{bmatrix} 1 & 2 \\ 4 & 6 \\ 9 & 12 \end{bmatrix}$$

Cycle

Cycle

Transfers control immediately to the next iteration of the current loop (**For**, **While**, or **Loop**).

Cycle is not allowed outside the three looping structures (**For**, **While**, or **Loop**).

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

Function listing that sums the integers from 1 to 100 skipping 50.

Define $g()$=Func	*Done*
Local *temp,i*	
$0 \to temp$	
For *i*,1,100,1	
If *i*=50	
Cycle	
$temp+i \to temp$	
EndFor	
Return *temp*	
EndFunc	
$g()$	5000

► Cylind

Vector ►**Cylind**

Note: You can insert this operator from the computer keyboard by typing **@>Cylind**.

Displays the row or column vector in cylindrical form [r, ∠ θ, z].

Vector must have exactly three elements. It can be either a row or a column.

$$\begin{bmatrix} 2 & 2 & 3 \end{bmatrix} \blacktriangleright \text{Cylind} \qquad \begin{bmatrix} 2 \cdot \sqrt{2} & \angle \dfrac{\pi}{4} & 3 \end{bmatrix}$$

cZeros()

Catalog > 📖

cZeros($Expr$**,** Var**)** $\Rightarrow list$

Returns a list of candidate real and non-real values of Var that make $Expr$=0. **cZeros()** does this by computing **exp▶list(cSolve(**$Expr$=0,Var**),**Var**)**. Otherwise, **cZeros()** is similar to **zeros()**.

Note: See also **cSolve()**, **solve()**, and **zeros()**.

cZeros({$Expr1$**,** $Expr2$[**,** …] **},**
 {$VarOrGuess1$**,**$VarOrGuess2$[**,** …] **})**
$\Rightarrow matrix$

Returns candidate positions where the expressions are zero simultaneously. Each $VarOrGuess$ specifies an unknown whose value you seek.

Optionally, you can specify an initial guess for a variable. Each $VarOrGuess$ must have the form:

variable
– or –
variable = real or non-real number

For example, x is valid and so is x=3+i.

If all of the expressions are polynomials and you do NOT specify any initial guesses, **cZeros()** uses the lexical Gröbner/Buchberger elimination method to attempt to determine **all** complex zeros.

Complex zeros can include both real and non-real zeros, as in the example to the right.

Each row of the resulting matrix represents an alternate zero, with the components ordered the same as the $VarOrGuess$ list. To extract a row, index the matrix by [row].

In Display Digits mode of Fix 3:

$$\text{cZeros}\left(x^5+4\cdot x^4+5\cdot x^3-6\cdot x-3,x\right)$$
$$\{-1.1138+1.07314\cdot \boldsymbol{i},-1.1138-1.07314\cdot \boldsymbol{i},-2.\blacktriangleright$$

To see the entire result,
press ▲ and then use ◄ and ► to move the cursor.

$$\text{cZeros}\left(\left\{u\cdot v-u-v,v^2+u\right\},\{u,v\}\right)$$
$$\begin{bmatrix} 0 & 0 \\ \dfrac{1}{2}-\dfrac{\sqrt{3}}{2}\cdot i & \dfrac{1}{2}+\dfrac{\sqrt{3}}{2}\cdot i \\ \dfrac{1}{2}+\dfrac{\sqrt{3}}{2}\cdot i & \dfrac{1}{2}-\dfrac{\sqrt{3}}{2}\cdot i \end{bmatrix}$$

Extract row 2:

$$Ans[2] \qquad \left[\dfrac{1}{2}-\dfrac{\sqrt{3}}{2}\cdot i \quad \dfrac{1}{2}+\dfrac{\sqrt{3}}{2}\cdot i\right]$$

Alphabetical Listing   43

cZeros()

Simultaneous polynomials can have extra variables that have no values, but represent given numeric values that could be substituted later.

$$\text{cZeros}\left(\left\{u\cdot v-u-c\cdot v^2,v^2+u\right\},\{u,v\}\right)$$
$$\begin{bmatrix} 0 & 0 \\ -(c-1)^2 & -(c-1) \end{bmatrix}$$

You can also include unknown variables that do not appear in the expressions. These zeros show how families of zeros might contain arbitrary constants of the form $\mathbf{c}k$, where k is an integer suffix from 1 through 255.

$$\text{cZeros}\left(\left\{u\cdot v-u-v,v^2+u\right\},\{u,v,w\}\right)$$
$$\text{cZero}\left(\left\{u\cdot(v-1)-v,u+v^2\right\},\{u,v,w\}\right)$$
$$\begin{bmatrix} 0 & 0 & c4 \\ \dfrac{1}{2}-\dfrac{\sqrt{3}}{2}\cdot i & \dfrac{1}{2}+\dfrac{\sqrt{3}}{2}\cdot i & c4 \\ \dfrac{1}{2}+\dfrac{\sqrt{3}}{2}\cdot i & \dfrac{1}{2}-\dfrac{\sqrt{3}}{2}\cdot i & c4 \end{bmatrix}$$

For polynomial systems, computation time or memory exhaustion may depend strongly on the order in which you list unknowns. If your initial choice exhausts memory or your patience, try rearranging the variables in the expressions and/or *VarOrGuess* list.

If you do not include any guesses and if any expression is non-polynomial in any variable but all expressions are linear in all unknowns, **cZeros()** uses Gaussian elimination to attempt to determine all zeros.

$$\text{cZeros}\left(\left\{u+v-e^w,u-v-i\right\},\{u,v\}\right)$$
$$\begin{bmatrix} \dfrac{e^w+i}{2} & \dfrac{e^w-i}{2} \end{bmatrix}$$

If a system is neither polynomial in all of its variables nor linear in its unknowns, **cZeros ()** determines at most one zero using an approximate iterative method. To do so, the number of unknowns must equal the number of expressions, and all other variables in the expressions must simplify to numbers.

$$\text{cZeros}\left(\left\{e^z-w,w-z^2\right\},\{w,z\}\right)$$
$$\begin{bmatrix} 0.494866 & -0.703467 \end{bmatrix}$$

A non-real guess is often necessary to determine a non-real zero. For convergence, a guess might have to be rather close to a zero.

$$\text{cZeros}\left(\left\{e{\sim}z-w,w-z^2\right\},\{w,z=1+i\}\right)$$
$$\begin{bmatrix} 0.149606+4.8919\cdot i & 1.58805+1.54022\cdot i \end{bmatrix}$$

D

dbd()

dbd(date1,date2**)** ⇒ *value*

Returns the number of days between *date1* and *date2* using the actual-day-count method.

dbd(12.3103,1.0104)	1
dbd(1.0107,6.0107)	151
dbd(3112.03,101.04)	1
dbd(101.07,106.07)	151

date1 and *date2* can be numbers or lists of numbers within the range of the dates on the standard calendar. If both *date1* and *date2* are lists, they must be the same length.

date1 and *date2* must be between the years 1950 through 2049.

You can enter the dates in either of two formats. The decimal placement differentiates between the date formats.

MM.DDYY (format used commonly in the United States)
DDMM.YY (format use commonly in Europe)

►DD Catalog > 📖

Expr1 **►DD** ⇒ *valueList1*
►DD ⇒ *listMatrix1*
►DD ⇒ *matrix*

Note: You can insert this operator from the computer keyboard by typing **@>DD**.

Returns the decimal equivalent of the argument expressed in degrees. The argument is a number, list, or matrix that is interpreted by the Angle mode setting in gradians, radians or degrees.

In Degree angle mode:

$(1.5°)$►DD	$1.5°$
$(45°22'14.3")$►DD	$45.3706°$
$(\{45°22'14.3", 60°0'0"\})$►DD	
	$\{45.3706°, 60°\}$

In Gradian angle mode:

1►DD	$\dfrac{9}{10}°$

In Radian angle mode:

(1.5)►DD	$85.9437°$

►Decimal Catalog > 📖

Expression1 **►Decimal** ⇒ *expression*

List1 **►Decimal** ⇒ *expression*

Matrix1 **►Decimal** ⇒ *expression*

Note: You can insert this operator from the computer keyboard by typing **@>Decimal**.

$\dfrac{1}{3}$►Decimal	0.333333

Displays the argument in decimal form.
This operator can be used only at the end of
the entry line.

Define   **Catalog >** 🔖

Define *Var* **=** *Expression*
Define *Function***(***Param1***,** *Param2***,** ...**) =**
Expression

Define $g(x,y)=2 \cdot x - 3 \cdot y$	*Done*
$g(1,2)$	-4
$1 \rightarrow a$: $2 \rightarrow b$: $g(a,b)$	-4
Define $h(x)=$when$(x<2, 2 \cdot x - 3, -2 \cdot x + 3)$	*Done*
$h(-3)$	-9
$h(4)$	-5

Defines the variable *Var* or the user-
defined function *Function*.

Parameters, such as *Param1*, provide
placeholders for passing arguments to the
function. When calling a user-defined
function, you must supply arguments (for
example, values or variables) that
correspond to the parameters. When called,
the function evaluates *Expression* using
the supplied arguments.

Var and *Function* cannot be the name of a
system variable or built-in function or
command.

Note: This form of **Define** is equivalent to
executing the expression: *expression* →
Function(*Param1,Param2*).

Define *Function***(***Param1***,** *Param2***,** ...**) =**
Func
    Block
EndFunc

Define $g(x,y)=$Func	*Done*
If $x>y$ Then	
Return x	
Else	
Return y	
EndIf	
EndFunc	
$g(3,-7)$	3

Define *Program***(***Param1***,** *Param2***,** ...**) =**
Prgm
    Block
EndPrgm

In this form, the user-defined function or
program can execute a block of multiple
statements.

Block can be either a single statement or a
series of statements on separate lines.
Block also can include expressions and
instructions (such as **If**, **Then**, **Else**, and **For**).

Define Catalog > 📖

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

Note: See also **Define LibPriv**, page 47, and **Define LibPub**, page 47.

$$Define\ g(x,y)=Prgm$$
$$If\ x{>}y\ Then$$
$$Disp\ x,"\ greater\ than\ ",y$$
$$Else$$
$$Disp\ x,"\ not\ greater\ than\ ",y$$
$$EndIf$$
$$EndPrgm$$

Done

$$g(3,-7)$$

3 greater than -7

Done

Define LibPriv Catalog > 📖

Define LibPriv *Var* **=** *Expression*
Define LibPriv *Function***(***Param1***,** *Param2***,** ...**) =** *Expression*

Define LibPriv *Function***(***Param1***,** *Param2***,** ...**) = Func**
    Block
EndFunc

Define LibPriv *Program***(***Param1***,** *Param2***,** ...**) = Prgm**
    Block
EndPrgm

Operates the same as **Define**, except defines a private library variable, function, or program. Private functions and programs do not appear in the Catalog.

Note: See also **Define**, page 46, and **Define LibPub**, page 47.

Define LibPub Catalog > 📖

Define LibPub *Var* **=** *Expression*
Define LibPub *Function***(***Param1***,** *Param2***,** ...**) =** *Expression*

Define LibPub *Function***(***Param1***,** *Param2***,** ...**) = Func**
    Block
EndFunc

Define LibPub   Catalog > 📖

Define LibPub *Program***(***Param1***,** *Param2***,**
...) = Prgm
   Block
EndPrgm

Operates the same as **Define**, except defines
a public library variable, function, or
program. Public functions and programs
appear in the Catalog after the library has
been saved and refreshed.

Note: See also **Define**, page 46, and **Define
LibPriv**, page 47.

---

deltaList()   See ΔList(), page 103.

---

deltaTmpCnv()   See ΔtmpCnv(), page 189.

DelVar   Catalog > 📖

DelVar *Var1*[**,** *Var2*] [**,** *Var3*] ...

DelVar *Var***.**

**Deletes the specified variable or variable
group from memory.**

If one or more of the variables are locked,
this command displays an error message
and deletes only the unlocked variables. See
unLock, page 197.

DelVar *Var***.** deletes all members of the
*Var***.** variable group (such as the statistics
stat.nn results or variables created using
the **LibShortcut()** function). The dot (**.**) in
this form of the **DelVar** command limits it
to deleting a variable group; the simple
variable *Var* is not affected.

$2 \to a$	2
$(a+2)^2$	16
DelVar a	*Done*
$(a+2)^2$	$(a+2)^2$

$aa.a := 45$	45
$aa.b := 5.67$	5.67
$aa.c := 78.9$	78.9
getVarInfo()	$\begin{bmatrix} aa.a & \text{"NUM"} & \text{"□"} \\ aa.b & \text{"NUM"} & \text{"□"} \\ aa.c & \text{"NUM"} & \text{"□"} \end{bmatrix}$
DelVar $aa.$	*Done*
getVarInfo()	"NONE"

delVoid()   Catalog > 📖

delVoid(*List1***)** ⇒ *list*

$$\text{delVoid}(\{1,\text{void},3\}) \qquad \{1,3\}$$

Returns a list that has the contents of *List1*
with all empty (void) elements removed.

For more information on empty elements,
see page 251.

derivative()   See *d*(), page 221.

deSolve()   Catalog > 📖

deSolve(*1stOr2ndOrderODE***,** *Var***,**
*depVar***)** ⇒ *a general solution*

$$\text{deSolve}(y''+2 \cdot y'+y=x^2,x,y)$$
$$y=(c3 \cdot x+c4) \cdot e^{-x}+x^2-4 \cdot x+6$$
$$\text{right}(Ans) \rightarrow temp \quad (c3 \cdot x+c4) \cdot e^{-x}+x^2-4 \cdot x+6$$
$$\frac{d^2}{dx^2}(temp)+2 \cdot \frac{d}{dx}(temp)+temp-x^2 \qquad 0$$
$$\text{DelVar } temp \qquad Done$$

Returns an equation that explicitly or
implicitly specifies a general solution to the
1st- or 2nd-order ordinary differential
equation (ODE). In the ODE:

- Use a prime symbol (press 🔳) to denote
  the 1st derivative of the dependent
  variable with respect to the independent
  variable.
- Use two prime symbols to denote the
  corresponding second derivative.

The prime symbol is used for derivatives
within deSolve() only. In other cases, use **d
()**.

The general solution of a 1st-order equation
contains an arbitrary constant of the form
c*k*, where *k* is an integer suffix from 1
through 255. The solution of a 2nd-order
equation contains two such constants.

Apply **solve()** to an implicit solution if you
want to try to convert it to one or more
equivalent explicit solutions.

$$\text{deSolve}(y'=(\cos(y))^2 \cdot x,x,y) \qquad \tan(y)=\frac{x^2}{2}+c4$$

$$\text{solve}(Ans,y)$$
$$y=\tan^{-1}\left(\frac{x^2+2 \cdot c4}{2}\right)+n3 \cdot \pi$$
$$Ans|c4=c-1 \text{ and } n3=0$$
$$y=\tan^{-1}\left(\frac{x^2+2 \cdot (c-1)}{2}\right)$$

When comparing your results with textbook
or manual solutions, be aware that different
methods introduce arbitrary constants at
different points in the calculation, which
may produce different general solutions.

deSolve(*1stOrderODE* **and** *initCond***,** *Var***,** *depVar***)** ⇒ *a particular solution*

Returns a particular solution that satisfies *1stOrderODE* and *initCond*. This is usually easier than determining a general solution, substituting initial values, solving for the arbitrary constant, and then substituting that value into the general solution.

initCond is an equation of the form:

depVar (*initialIndependentValue*) = *initialDependentValue*

The *initialIndependentValue* and *initialDependentValue* can be variables such as x0 and y0 that have no stored values. Implicit differentiation can help verify implicit solutions.

$$\sin(y) = \left(y \cdot e^x + \cos(y)\right) \cdot y' \rightarrow ode$$
$$\sin(y) = \left(e^x \cdot y + \cos(y)\right) \cdot y'$$
$$\text{deSolve}\left(ode \text{ and } y(0){=}0, x, y\right) \rightarrow soln$$
$$\frac{-\left(2 \cdot \sin(y) + y^2\right)}{2} = -\left(e^x - 1\right) \cdot e^{-x} \cdot \sin(y)$$

$soln \| x{=}0 \text{ and } y{=}0$	*true*
$ode \| y'{=}\text{impDif}\left(soln, x, y\right)$	*true*
DelVar *ode,soln*	*Done*

deSolve(*2ndOrderODE* **and** *initCond1* **and** *initCond2***,** *Var***,** *depVar***)** ⇒ *particular solution*

Returns a particular solution that satisfies *2nd Order ODE* and has a specified value of the dependent variable and its first derivative at one point.

For *initCond1*, use the form:

depVar (*initialIndependentValue*) = *initialDependentValue*

For *initCond2*, use the form:

depVar (*initialIndependentValue*) = *initial1stDerivativeValue*

$$\text{deSolve}\left(y''{=}y^{\frac{-1}{2}} \text{ and } y(0){=}0 \text{ and } y'(0){=}0, t, y\right)$$
$$\frac{2 \cdot y^{\frac{3}{4}}}{3} = t$$

$$\text{solve}\left(\frac{2 \cdot y^{\frac{3}{4}}}{3} = t, y\right)$$
$$y = \frac{3 \cdot 3^{\frac{1}{3}} \cdot 2^{\frac{2}{3}} \cdot t^{\frac{4}{3}}}{4} \text{ and } t \geq 0$$

deSolve(*2ndOrderODE* **and** *bndCond1* **and** *bndCond2***,** *Var***,** *depVar***)** ⇒ *a particular solution*

Returns a particular solution that satisfies *2ndOrderODE* and has specified values at two different points.

$$\text{deSolve}\left(y''{=}x \text{ and } y(0){=}1 \text{ and } y'(2){=}3, x, y\right)$$
$$y = \frac{x^3}{6} + x + 1$$
$$\text{deSolve}\left(y''{=}2 \cdot y' \text{ and } y(3){=}1 \text{ and } y'(4){=}2, x, y\right)$$
$$y = e^{2 \cdot x - 8} - e^{-2} + 1$$

deSolve()

$$\text{deSolve}\left(w''-\frac{2\cdot w'}{x}+\left(9+\frac{2}{x^2}\right)\cdot w=x\cdot e^x \text{ and } w\left(\frac{\pi}{6}\right)=0 \text{ and } w\left(\frac{\pi}{3}\right)=0,x,w\right)$$

$$w=\frac{x\cdot e^x}{\left(\ln(e)\right)^2+9}+\frac{e^{\frac{\pi}{3}}\cdot x\cdot\cos(3\cdot x)}{\left(\ln(e)\right)^2+9}-\frac{e^{\frac{\pi}{6}}\cdot x\cdot\sin(3\cdot x)}{\left(\ln(e)\right)^2+9}$$

det()

det(*squareMatrix*[**,** *Tolerance*]**)** ⇒
expression

Returns the determinant of *squareMatrix*.

Optionally, any matrix element is treated as zero if its absolute value is less than *Tolerance*. This tolerance is used only if the matrix has floating-point entries and does not contain any symbolic variables that have not been assigned a value. Otherwise, *Tolerance* is ignored.

- If you use ⌈ctrl⌉ ⌈enter⌉ or set the **Auto or Approximate** mode to Approximate, computations are done using floating-point arithmetic.
- If *Tolerance* is omitted or not used, the default tolerance is calculated as:
  5E⁻14 •**max(dim(***squareMatrix***))**
  •**rowNorm(***squareMatrix***)**

$$\det\begin{bmatrix} a & b \\ c & d \end{bmatrix} \qquad a\cdot d - b\cdot c$$

$$\det\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \qquad -2$$

$$\det\left(\text{identity}(3)-x\cdot\begin{bmatrix} 1 & -2 & 3 \\ -2 & 4 & 1 \\ -6 & -2 & 7 \end{bmatrix}\right)$$
$$-\left(98\cdot x^3-55\cdot x^2+12\cdot x-1\right)$$

$$\begin{bmatrix} 1.\text{E}20 & 1 \\ 0 & 1 \end{bmatrix}\rightarrow mat1 \qquad \begin{bmatrix} 1.\text{E}20 & 1 \\ 0 & 1 \end{bmatrix}$$

$$\det(mat1) \qquad 0$$

$$\det(mat1,.1) \qquad 1.\text{E}20$$

diag()

diag(*List***)** ⇒ *matrix*
diag(*rowMatrix***)** ⇒ *matrix*
diag(*columnMatrix***)** ⇒ *matrix*

Returns a matrix with the values in the argument list or matrix in its main diagonal.

diag(*squareMatrix***)** ⇒ *rowMatrix*

Returns a row matrix containing the elements from the main diagonal of *squareMatrix*.

squareMatrix must be square.

$$\text{diag}\left(\begin{bmatrix} 2 & 4 & 6 \end{bmatrix}\right) \qquad \begin{bmatrix} 2 & 0 & 0 \\ 0 & 4 & 0 \\ 0 & 0 & 6 \end{bmatrix}$$

$$\begin{bmatrix} 4 & 6 & 8 \\ 1 & 2 & 3 \\ 5 & 7 & 9 \end{bmatrix} \qquad \begin{bmatrix} 4 & 6 & 8 \\ 1 & 2 & 3 \\ 5 & 7 & 9 \end{bmatrix}$$

$$\text{diag}(Ans) \qquad \begin{bmatrix} 4 & 2 & 9 \end{bmatrix}$$

dim()

dim(*List***)** ⇒ *integer*

Returns the dimension of *List*.

$$\dim(\{0,1,2\}) \qquad\qquad 3$$

dim(*Matrix***)** ⇒ *list*

Returns the dimensions of matrix as a two-element list {rows, columns}.

$$\dim\!\left(\begin{bmatrix}1 & -1 \\ 2 & -2 \\ 3 & 5\end{bmatrix}\right) \qquad\qquad \{3,2\}$$

dim(*String***)** ⇒ *integer*

Returns the number of characters contained in character string *String*.

$$\dim("Hello") \qquad\qquad 5$$
$$\dim("Hello\ "\&"there") \qquad\qquad 11$$

Disp

Disp *exprOrString1* [**,** *exprOrString2*] ...

Displays the arguments in the *Calculator* history. The arguments are displayed in succession, with thin spaces as separators.

Useful mainly in programs and functions to ensure the display of intermediate calculations.

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

Define *chars*(*start*,*end*)=Prgm
    For *i*,*start*,*end*
    Disp *i*," ",char(*i*)
    EndFor
    EndPrgm
                Done

chars(240,243)
        240 ð
        241 ñ
        242 ò
        243 ó
               Done

DispAt

DispAt *int*,*expr1* [,*expr2* ...] ...
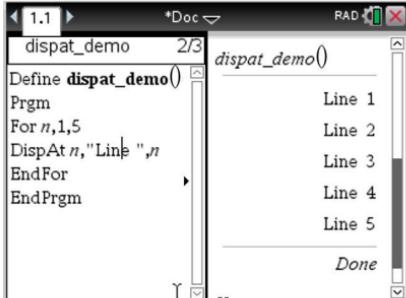

DispAt allows you to specify the line where the specified expression or string will be displayed on the screen.

The line number can be specified as an expression.

Please note that the line number is not for the entire screen but for the area immediately following the command/program.

DispAt

Example
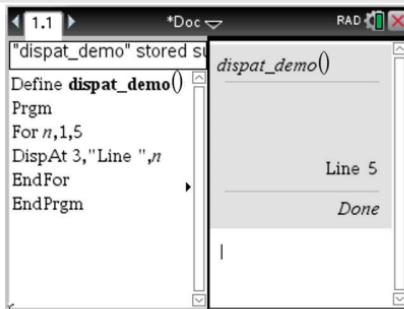

DispAt   Catalog > 📖

This command allows dashboard-like output from programs where the value of an expression or from a sensor reading is updated on the same line.

DispAt and Disp can be used within the same program.

Note: The maximum number is set to 8 since that matches a screen-full of lines on the handheld screen - as long as the lines don't have 2D math expressions. The exact number of lines depends on the content of the displayed information.

```
◀ 1.1 ▶          *Doc ▽          RAD ▤ ▯ ✕
"dispat_demo" stored su   dispat_demo()
Define dispat_demo()
Prgm
For n,1,5
DispAt 3,"Line ",n                          Line 5
EndFor                ▶
EndPrgm                                         Done

                      ▽   |
```

Illustrative examples:

Define z()=	Output
Prgm	z()
For n,1,3	Iteration 1:
DispAt 1,"N: ",n	Line 1: N:1
Disp "Hello"	Line 2: Hello
EndFor	
EndPrgm	Iteration 2:
	Line 1: N:2
	Line 2: Hello
	Line 3: Hello
	Iteration 3:
	Line 1: N:3
	Line 2: Hello
	Line 3: Hello
	Line 4: Hello
Define z1()=	z1()
Prgm	Line 1: N:3
For n,1,3	Line 2: Hello
DispAt 1,"N: ",n	Line 3: Hello
EndFor	Line 4: Hello
	Line 5: Hello
For n,1,4	
Disp "Hello"	
EndFor	
EndPrgm	

Error conditions:

Error Message	Description
DispAt line number must be between 1 and 8	Expression evaluates the line number outside the range 1-8 (inclusive)
Too few arguments	The function or command is missing one or more arguments.
No arguments	Same as current 'syntax error' dialog
Too many arguments	Limit argument. Same error as Disp.
Invalid data type	First argument must be a number.
Void: DispAt void	"Hello World" Datatype error is thrown for the void (if the callback is defined)
Conversion operator: DispAt 2_ft @> _m, "Hello World"	**CAS**: Datatype Error is thrown (if the callback is defined)
	Numeric: Conversion will be evaluated and if the result is a valid argument, DispAt print the string at the result line.

►DMS   **Catalog > 📖**

Expr **►DMS**

List **►DMS**

Matrix **►DMS**

In Degree angle mode:

(45.371)►DMS	45°22'15.6"
$(\{45.371,60\})$►DMS	$\{45°22'15.6",60°\}$

Note: You can insert this operator from the computer keyboard by typing @>DMS.

Interprets the argument as an angle and displays the equivalent DMS (DDDDDD°MM'SS.ss'') number. See °, ', '' on page 228 for DMS (degree, minutes, seconds) format.

Note: ►DMS will convert from radians to degrees when used in radian mode. If the input is followed by a degree symbol ° , no conversion will occur. You can use ►DMS only at the end of an entry line.

domain()

domain(*Expr1***,** *Var***)** ⇒ *expression*

Returns the domain of *Expr1* with respect to *Var*.

domain() can be used to examine domains of functions. It is restricted to real and finite domain.

This functionality has limitations due to shortcomings of computer algebra simplification and solver algorithms.

Certain functions cannot be used as arguments for **domain()**, regardless of whether they appear explicitly or within user-defined variables and functions. In the following example, the expression cannot be simplified because ∫() is a disallowed function.

$\text{domain}\left(\dfrac{1}{x+y}, y\right)$	$-\infty < y < -x \text{ or } -x < y < \infty$
$\text{domain}\left(\dfrac{x+1}{x^2+2\cdot x}, x\right)$	$x \neq -2 \text{ and } x \neq 0$
$\text{domain}\left(\left(\sqrt{x}\right)^2, x\right)$	$0 \leq x < \infty$
$\text{domain}\left(\dfrac{1}{x+y}, y\right)$	$-\infty < y < -x \text{ or } -x < y < \infty$

$$\text{domain}\left(\int_1^x \frac{1}{t}\,dt, x\right) \blacktriangleright \text{domain}\left(\int_1^x \frac{1}{t}\,dt, x\right)$$

dominantTerm()

dominantTerm(*Expr1***,** *Var* **[,** *Point***])** ⇒ *expression*

dominantTerm(*Expr1***,** *Var* **[,** *Point***]) |** *Var*>*Point* ⇒ *expression*

dominantTerm(*Expr1***,** *Var* **[,** *Point***]) |** *Var*<*Point* ⇒ *expression*

$\text{dominantTerm}(\tan(\sin(x))-\sin(\tan(x)), x)$	$\dfrac{x^7}{30}$
$\text{dominantTerm}\left(\dfrac{1-\cos(x-1)}{(x-1)^3}, x, 1\right)$	$\dfrac{1}{2\cdot(x-1)}$
$\text{dominantTerm}\left(x^{-2}\cdot\tan\left(x^{\frac{1}{3}}\right), x\right)$	$\dfrac{1}{x^{\frac{5}{3}}}$
$\text{dominantTerm}(\ln(x^x-1)\cdot x^{-2}, x)$	$\dfrac{\ln(x\cdot\ln(x))}{x^2}$

dominantTerm()

Returns the dominant term of a power series representation of $Expr1$ expanded about $Point$. The dominant term is the one whose magnitude grows most rapidly near $Var = Point$. The resulting power of ($Var - Point$) can have a negative and/or fractional exponent. The coefficient of this power can include logarithms of ($Var - Point$) and other functions of Var that are dominated by all powers of ($Var - Point$) having the same exponent sign.

$Point$ defaults to 0. $Point$ can be ∞ or $-\infty$, in which cases the dominant term will be the term having the largest exponent of Var rather than the smallest exponent of Var.

dominantTerm(…) returns "**dominantTerm (…)**" if it is unable to determine such a representation, such as for essential singularities such as sin($1/z$) at z=0, $e^{-1/z}$ at z=0, or e^z at z = ∞ or $-\infty$.

If the series or one of its derivatives has a jump discontinuity at $Point$, the result is likely to contain sub-expressions of the form sign(…) or abs(…) for a real expansion variable or (-1)^floor(…angle(…)…) for a complex expansion variable, which is one ending with "_". If you intend to use the dominant term only for values on one side of $Point$, then append to **dominantTerm(**…**)** the appropriate one of "| $Var > Point$", "| $Var < Point$", "| "$Var \geq Point$", or "$Var \leq Point$" to obtain a simpler result.

dominantTerm() distributes over 1st-argument lists and matrices.

dominantTerm() is useful when you want to know the simplest possible expression that is asymptotic to another expression as $Var \rightarrow Point$. **dominantTerm()** is also useful when it isn't obvious what the degree of the first non-zero term of a series will be, and you don't want to iteratively guess either interactively or by a program loop.

$$\text{dominantTerm}\left(e^{\frac{-1}{z}}, z\right)$$

$$\text{dominantTerm}\left(e^{\frac{-1}{z}}, z, 0\right)$$

$$\text{dominantTerm}\left(\left(1+\frac{1}{n}\right)^n, n, \infty\right) \qquad e$$

$$\text{dominantTerm}\left(\tan^{-1}\left(\frac{1}{x}\right), x, 0\right) \qquad \frac{\pi \cdot \text{sign}(x)}{2}$$

$$\text{dominantTerm}\left(\tan^{-1}\left(\frac{1}{x}\right), x\right) | x > 0 \qquad \frac{\pi}{2}$$

dominantTerm()

dotP()

dotP($List1$**,** $List2$**)** ⇒ *expression*

Returns the "dot" product of two lists.

$$\text{dotP}\left(\{a,b,c\},\{d,e,f\}\right) \qquad a{\cdot}d{+}b{\cdot}e{+}c{\cdot}f$$

$$\text{dotP}\left(\{1,2\},\{5,6\}\right) \qquad 17$$

dotP($Vector1$**,** $Vector2$**)** ⇒ *expression*

Returns the "dot" product of two vectors.

Both must be row vectors, or both must be column vectors.

$$\text{dotP}\left(\begin{bmatrix} a & b & c \end{bmatrix}, \begin{bmatrix} d & e & f \end{bmatrix}\right) \qquad a{\cdot}d{+}b{\cdot}e{+}c{\cdot}f$$

$$\text{dotP}\left(\begin{bmatrix} 1 & 2 & 3 \end{bmatrix}, \begin{bmatrix} 4 & 5 & 6 \end{bmatrix}\right) \qquad 32$$

See Also: TI-Nspire™ CX II - Draw Commands

E

*e^*()

*e^*(*Expr1*) ⇒ *expression*

Returns *e* raised to the *Expr1* power.

Note: See also *e exponent template*, page 2.

Note: Pressing $\boxed{e^x}$ to display *e^*(is different from pressing the character $\boxed{E}$ on the keyboard.

You can enter a complex number in re$^{i\theta}$ polar form. However, use this form in Radian angle mode only; it causes a Domain error in Degree or Gradian angle mode.

$$e^1 \qquad\qquad e$$

$$e^{1.} \qquad\qquad 2.71828$$

$$e^{3^2} \qquad\qquad e^9$$

*e^*(*List1*) ⇒ *list*

Returns *e* raised to the power of each element in *List1*.

$$e^{\{1,1.,0.5\}} \qquad \{e, 2.71828, 1.64872\}$$

*e^*(*squareMatrix1*) ⇒ *squareMatrix*

$$e^{\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}} \quad \begin{bmatrix} 782.209 & 559.617 & 456.509 \\ 680.546 & 488.795 & 396.521 \\ 524.929 & 371.222 & 307.879 \end{bmatrix}$$

e^()   `e^x` key

Returns the matrix exponential of
squareMatrix1. This is not the same as
calculating e raised to the power of each
element. For information about the
calculation method, refer to **cos()**.

squareMatrix1 must be diagonalizable. The
result always contains floating-point
numbers.

eff()   Catalog > 📖

eff(*nominalRate,CpY***)** ⇒ *value*

$$\text{eff}(5.75,12) \qquad\qquad 5.90398$$

Financial function that converts the nominal
interest rate *nominalRate* to an annual
effective rate, given *CpY* as the number of
compounding periods per year.

nominalRate must be a real number, and
CpY must be a real number > 0.

Note: See also **nom()**, page 123.

eigVc()   Catalog > 📖

eigVc(*squareMatrix***)** ⇒ *matrix*

Returns a matrix containing the
eigenvectors for a real or complex
squareMatrix, where each column in the
result corresponds to an eigenvalue. Note
that an eigenvector is not unique; it may be
scaled by any constant factor. The
eigenvectors are normalized, meaning that:

if V = [x_1, x_2, … , x_n]

then $x_1^2 + x_2^2 + \ldots + x_n^2 = 1$

squareMatrix is first balanced with
similarity transformations until the row and
column norms are as close to the same
value as possible. The *squareMatrix* is then
reduced to upper Hessenberg form and the
eigenvectors are computed via a Schur
factorization.

In Rectangular Complex Format:

$$\begin{bmatrix} -1 & 2 & 5 \\ 3 & -6 & 9 \\ 2 & -5 & 7 \end{bmatrix} \rightarrow m1 \qquad \begin{bmatrix} -1 & 2 & 5 \\ 3 & -6 & 9 \\ 2 & -5 & 7 \end{bmatrix}$$

$$\text{eigVc}(m1)$$
$$\begin{bmatrix} -0.800906 & 0.767947 & (\\ 0.484029 & 0.573804+0.052258\cdot i & 0.5738\blacktriangleright \\ 0.352512 & 0.262687+0.096286\cdot i & 0.2626 \end{bmatrix}$$

To see the entire result,
press ▲ and then use ◄ and ► to move the
cursor.

eigVl()	**Catalog >** 📖

eigVl(_squareMatrix_**)** ⇒ _list_

Returns a list of the eigenvalues of a real or complex _squareMatrix_.

squareMatrix is first balanced with similarity transformations until the row and column norms are as close to the same value as possible. The _squareMatrix_ is then reduced to upper Hessenberg form and the eigenvalues are computed from the upper Hessenberg matrix.

In Rectangular complex format mode:

$$\begin{bmatrix} -1 & 2 & 5 \\ 3 & -6 & 9 \\ 2 & -5 & 7 \end{bmatrix} \rightarrow m1 \qquad \begin{bmatrix} -1 & 2 & 5 \\ 3 & -6 & 9 \\ 2 & -5 & 7 \end{bmatrix}$$

$\text{eigVl}(m1)$

$\{-4.40941, 2.20471 + 0.763006 \cdot i, 2.20471 - 0.\blacktriangleright$

To see the entire result,
press ▲ and then use ◄ and ► to move the cursor.

euler ()

euler(*Expr*, *Var*, *depVar*, {*Var0, VarMax*}, *depVar0*, *VarStep* [, *eulerStep*]**)** ⇒ *matrix*

euler(*SystemOfExpr*, *Var*, *ListOfDepVars*, {*Var0, VarMax*}, *ListOfDepVars0*, *VarStep* [, *eulerStep*]**)** ⇒ *matrix*

euler(*ListOfExpr*, *Var*, *ListOfDepVars*, {*Var0, VarMax*}, *ListOfDepVars0*, *VarStep* [, *eulerStep*]**)** ⇒ *matrix*

Uses the Euler method to solve the system
$$\frac{d\,depVar}{d\,Var} = Expr(Var, depVar)$$
with *depVar*(*Var0*)=*depVar0* on the interval [*Var0,VarMax*]. Returns a matrix whose first row defines the *Var* output values and whose second row defines the value of the first solution component at the corresponding *Var* values, and so on.

Expr is the right-hand side that defines the ordinary differential equation (ODE).

Differential equation:
y'=0.001*y*(100-y) and y(0)=10

$$\text{euler}\left(0.001 \cdot y \cdot (100-y), t, y, \{0,100\}, 10, 1\right)$$

0.	1.	2.	3.	4.
10.	10.9	11.8712	12.9174	14.042

To see the entire result, press ▲ and then use ◄ and ► to move the cursor.

Compare above result with CAS exact solution obtained using deSolve() and seqGen():

SystemOfExpr is the system of right-hand sides that define the system of ODEs (corresponds to order of dependent variables in *ListOfDepVars*).

ListOfExpr is a list of right-hand sides that define the system of ODEs (corresponds to the order of dependent variables in *ListOfDepVars*).

Var is the independent variable.

ListOfDepVars is a list of dependent variables.

{*Var0, VarMax*} is a two-element list that tells the function to integrate from *Var0* to *VarMax*.

ListOfDepVars0 is a list of initial values for dependent variables.

VarStep is a nonzero number such that **sign** (*VarStep*) = **sign(***VarMax-Var0***)** and solutions are returned at *Var0+i•VarStep* for all *i*=0,1,2,... such that *Var0+i•VarStep* is in [*var0,VarMax*] (there may not be a solution value at *VarMax*).

eulerStep is a positive integer (defaults to 1) that defines the number of euler steps between output values. The actual step size used by the euler method is *VarStep / eulerStep*.

$$\text{deSolve}\left(y'=0.001 \cdot y \cdot (100-y) \text{ and } y(0)=10, t, y\right)$$

$$y=\frac{100. \cdot (1.10517)^t}{(1.10517)^t+9.}$$

$$\text{seqGen}\left(\frac{100. \cdot (1.10517)^t}{(1.10517)^t+9.}, t, y, \{0, 100\}\right)$$

$$\{10., 10.9367, 11.9494, 13.0423, 14.2189 \blacktriangleright$$

System of equations:

$$\begin{cases} y1'=-y1+0.1 \cdot y1 \cdot y2 \\ y2=3 \cdot y2-y1 \cdot y2 \end{cases}$$

with $y1(0)=2$ and $y2(0)=5$

$$\text{euler}\left(\begin{cases} -y1+0.1 \cdot y1 \cdot y2 \\ 3 \cdot y2-y1 \cdot y2 \end{cases}, t, \{y1, y2\}, \{0, 5\}, \{2, 5\}, 1\right)$$

$$\begin{bmatrix} 0. & 1. & 2. & 3. & 4. & 5. \\ 2. & 1. & 1. & 3. & 27. & 243. \\ 5. & 10. & 30. & 90. & 90. & -2070. \end{bmatrix}$$

---

eval(*Expr***)** $\Rightarrow$ *string*

eval() is valid only in the TI-Innovator™ Hub Command argument of programming commands **Get**, **GetStr**, and **Send**. The software evaluates expression *Expr* and replaces the **eval()** statement with the result as a character string.

The argument *Expr* must simplify to a real number.

Set the blue element of the RGB LED to half intensity.

$lum:=127$	127
Send "SET COLOR.BLUE eval(lum)"	*Done*

Reset the blue element to OFF.

Send "SET COLOR.BLUE OFF"	*Done*

eval() argument must simplify to a real number.

Send "SET LED eval("4") TO ON"
                    "Error: Invalid data type"

Program to fade-in the red element

Define **fadein**()=
Prgm
For *i*,0,255,10
  Send "SET COLOR.RED eval(i)"
    Wait 0.1
  EndFor
  Send "SET COLOR.RED OFF"
EndPrgm

Execute the program.

fadein()   *Done*

Although **eval()** does not display its result, you can view the resulting Hub command string after executing the command by inspecting any of the following special variables.

n:=0.25	0.25
m:=8	8
n·m	2.

Send "SET COLOR.BLUE ON TIME eval(n·m)"
                                          Done
iostr.SendAns   "SET COLOR.BLUE ON TIME 2"

iostr.SendAns
iostr.GetAns
iostr.GetStrAns

Note: See also **Get** (page 77), **GetStr** (page 84), and **Send** (page 158).

---

exact(*Expr1* [**,** *Tolerance*]**)** ⇒ *expression*
exact(*List1* [**,** *Tolerance*]**)** ⇒ *list*
exact(*Matrix1* [**,** *Tolerance*]**)** ⇒ *matrix*

Uses Exact mode arithmetic to return, when possible, the rational-number equivalent of the argument.

Tolerance specifies the tolerance for the conversion; the default is 0 (zero).

$$\text{exact}(0.25) \qquad \frac{1}{4}$$

$$\text{exact}(0.333333) \qquad \frac{333333}{1000000}$$

$$\text{exact}(0.333333,0.001) \qquad \frac{1}{3}$$

$$\text{exact}(3.5 \cdot x + y) \qquad \frac{7 \cdot x}{2} + y$$

$$\text{exact}(\{0.2,0.33,4.125\}) \qquad \left\{ \frac{1}{5}, \frac{33}{100}, \frac{33}{8} \right\}$$

Exit	Catalog >

Exit

Exits the current **For**, **While**, or **Loop** block.

Exit is not allowed outside the three looping structures (**For**, **While**, or **Loop**).

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

Function listing:

Define $g()$=Func	*Done*
$\quad$ Local *temp*,*i*	
$\quad 0 \to temp$	
$\quad$ For *i*,1,100,1	
$\quad temp + i \to temp$	
$\quad$ If *temp*>20 Then	
$\quad$ Exit	
$\quad$ EndIf	
$\quad$ EndFor	
$\quad$ EndFunc	
$g()$	21

▶exp	Catalog >

Expr▶**exp**

Represents *Expr* in terms of the natural exponential *e*. This is a display conversion operator. It can be used only at the end of the entry line.

Note: You can insert this operator from the computer keyboard by typing `@>exp`.

$\dfrac{d}{dx}\left(e^{x}+e^{-x}\right)$	$2 \cdot \sinh(x)$
$2 \cdot \sinh(x)$▶exp	$e^{x}-e^{-x}$

exp()	e^x key

exp(*Expr1***)** $\Rightarrow$ *expression*

Returns *e* raised to the *Expr1* power.

Note: See also *e* exponent template, page 2.

You can enter a complex number in re$^{i\theta}$ polar form. However, use this form in Radian angle mode only; it causes a Domain error in Degree or Gradian angle mode.

e^{1}	e
$e^{1.}$	2.71828
$e^{3^{2}}$	e^{9}

exp(*List1***)** $\Rightarrow$ *list*

Returns *e* raised to the power of each element in *List1*.

$e^{\{1,1.,0.5\}}$	$\{e,2.71828,1.64872\}$

exp()

exp(*squareMatrix1***)** ⇒ *squareMatrix*

Returns the matrix exponential of *squareMatrix1*. This is not the same as calculating *e* raised to the power of each element. For information about the calculation method, refer to **cos()**.

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

$$e^{\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}} \quad \begin{bmatrix} 782.209 & 559.617 & 456.509 \\ 680.546 & 488.795 & 396.521 \\ 524.929 & 371.222 & 307.879 \end{bmatrix}$$

exp►list()

exp►list(*Expr***,***Var***)** ⇒ *list*

Examines *Expr* for equations that are separated by the word "**or**," and returns a list containing the right-hand sides of the equations of the form *Var=Expr*. This gives you an easy way to extract some solution values embedded in the results of the **solve()**, **cSolve()**, **fMin()**, and **fMax()** functions.

Note: exp►list() is not necessary with the **zeros()** and **cZeros()** functions because they return a list of solution values directly.

You can insert this function from the keyboard by typing **exp@>list(**...**)**.

$$\text{solve}\left(x^2 - x - 2 = 0, x\right) \qquad x = -1 \text{ or } x = 2$$
$$\text{exp} \blacktriangleright \text{list}\left(\text{solve}\left(x^2 - x - 2 = 0, x\right), x\right) \qquad \{-1, 2\}$$

expand()

expand(*Expr1* [**,** *Var***])** ⇒ *expression*
expand(*List1* [**,***Var***])** ⇒ *list*
expand(*Matrix1* [**,***Var***])** ⇒ *matrix*

expand(*Expr1***)** returns *Expr1* expanded with respect to all its variables. The expansion is polynomial expansion for polynomials and partial fraction expansion for rational expressions.

The goal of **expand()** is to transform *Expr1* into a sum and/or difference of simple terms. In contrast, the goal of **factor()** is to transform *Expr1* into a product and/or quotient of simple factors.

$$\text{expand}\left((x + y + 1)^2\right)$$
$$x^2 + 2 \cdot x \cdot y + 2 \cdot x + y^2 + 2 \cdot y + 1$$
$$\text{expand}\left(\frac{x^2 - x + y^2 - y}{x^2 \cdot y^2 - x^2 \cdot y - x \cdot y^2 + x \cdot y}\right)$$
$$\frac{1}{x-1} - \frac{1}{x} + \frac{1}{y-1} - \frac{1}{y}$$

expand()

expand(*Expr1*,*Var***)** returns *Expr1* expanded with respect to *Var*. Similar powers of *Var* are collected. The terms and their factors are sorted with *Var* as the main variable. There might be some incidental factoring or expansion of the collected coefficients. Compared to omitting *Var*, this often saves time, memory, and screen space, while making the expression more comprehensible.

$$\text{expand}\left((x+y+1)^2,y\right) \qquad y^2+2\cdot y\cdot(x+1)+(x+1)^2$$

$$\text{expand}\left((x+y+1)^2,x\right) \qquad x^2+2\cdot x\cdot(y+1)+(y+1)^2$$

$$\text{expand}\left(\frac{x^2-x+y^2-y}{x^2\cdot y^2-x^2\cdot y-x\cdot y^2+x\cdot y},y\right)$$
$$\frac{1}{y-1}-\frac{1}{y}+\frac{1}{x\cdot(x-1)}$$

$$\text{expand}(Ans,x) \qquad \frac{1}{x-1}-\frac{1}{x}+\frac{1}{y\cdot(y-1)}$$

Even when there is only one variable, using *Var* might make the denominator factorization used for partial fraction expansion more complete.

$$\text{expand}\left(\frac{x^3+x^2-2}{x^2-2}\right) \qquad \frac{2\cdot x}{x^2-2}+x+1$$

$$\text{expand}(Ans,x) \qquad \frac{1}{x-\sqrt{2}}+\frac{1}{x+\sqrt{2}}+x+1$$

Hint: For rational expressions, **propFrac()** is a faster but less extreme alternative to **expand()**.

Note: See also **comDenom()** for an expanded numerator over an expanded denominator.

expand(*Expr1*,[*Var*]**)** also distributes logarithms and fractional powers regardless of *Var*. For increased distribution of logarithms and fractional powers, inequality constraints might be necessary to guarantee that some factors are nonnegative.

$$\ln(2\cdot x\cdot y)+\sqrt{2\cdot x\cdot y} \qquad \ln(2\cdot x\cdot y)+\sqrt{2\cdot x\cdot y}$$

$$\text{expand}(Ans) \qquad \ln(x\cdot y)+\sqrt{2}\cdot\sqrt{x\cdot y}+\ln(2)$$

$$\text{expand}(Ans)|y\geq0$$
$$\ln(x)+\sqrt{2}\cdot\sqrt{x}\cdot\sqrt{y}+\ln(y)+\ln(2)$$

$$\text{sign}(x\cdot y)+|x\cdot y|+e^{2\cdot x+y}$$
$$e^{2\cdot x+y}+\text{sign}(x\cdot y)+|x\cdot y|$$

expand(*Expr1*, [*Var*]**)** also distributes absolute values, **sign()**, and exponentials, regardless of *Var*.

$$\text{expand}(Ans)$$
$$\text{sign}(x)\cdot\text{sign}(y)+|x|\cdot|y|+\left(e^x\right)^2\cdot e^y$$

Note: See also **tExpand()** for trigonometric angle-sum and multiple-angle expansion.

expr()

expr(*String***)** ⇒ *expression*

Returns the character string contained in *String* as an expression and immediately executes it.

$$\text{expr}\left("1+2+x^2+x"\right) \qquad x^2+x+3$$

$$\text{expr}\left("\text{expand}((1+x)^2)"\right) \qquad x^2+2\cdot x+1$$

$$"\text{Define cube}(x)=x^3" \rightarrow funcstr$$
$$"\text{Define cube}(x)=x^3"$$

$$\text{expr}(funcstr) \qquad Done$$

$$cube(2) \qquad 8$$

ExpReg *X, Y* [, [*Freq*] [, *Category, Include*]]

Computes the exponential regression y = a•(b)ˣ on lists *X* and *Y* with frequency *Freq*. A summary of results is stored in the *stat.results* variable. (See page 176.)

All the lists must have equal dimension except for *Include*.

X and *Y* are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding *X* and *Y* data point. The default value is 1. All elements must be integers ≥ 0.

Category is a list of category codes for the corresponding *X* and *Y* data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.RegEqn	Regression equation: a•(b)ˣ
stat.a, stat.b	Regression coefficients
stat.r²	Coefficient of linear determination for transformed data
stat.r	Correlation coefficient for transformed data (x, ln(y))
stat.Resid	Residuals associated with the exponential model
stat.ResidTrans	Residuals associated with linear fit of transformed data
stat.XReg	List of data points in the modified *X List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.YReg	List of data points in the modified *Y List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*

Output variable	Description
stat.FreqReg	List of frequencies corresponding to *stat.XReg* and *stat.YReg*

F

factor()

factor(*Expr1*[**,** *Var*]**)** ⇒ *expression*
factor(*List1*[**,***Var*]**)** ⇒ *list*
factor(*Matrix1*[**,***Var*]**)** ⇒ *matrix*

factor(*Expr1***)** returns *Expr1* factored with respect to all of its variables over a common denominator.

$$\text{factor}\left(a^3 \cdot x^2 - a \cdot x^2 - a^3 + a\right)$$
$$a \cdot (a-1) \cdot (a+1) \cdot (x-1) \cdot (x+1)$$
$$\text{factor}\left(x^2+1\right) \qquad x^2+1$$
$$\text{factor}\left(x^2-4\right) \qquad (x-2) \cdot (x+2)$$
$$\text{factor}\left(x^2-3\right) \qquad x^2-3$$
$$\text{factor}\left(x^2-a\right) \qquad x^2-a$$

Expr1 is factored as much as possible toward linear rational factors without introducing new non-real subexpressions. This alternative is appropriate if you want factorization with respect to more than one variable.

factor(*Expr1***,***Var***)** returns *Expr1* factored with respect to variable *Var*.

$$\text{factor}\left(a^3 \cdot x^2 - a \cdot x^2 - a^3 + a, x\right)$$
$$a \cdot \left(a^2-1\right) \cdot (x-1) \cdot (x+1)$$
$$\text{factor}\left(x^2-3, x\right) \qquad (x+\sqrt{3}) \cdot (x-\sqrt{3})$$
$$\text{factor}\left(x^2-a, x\right) \qquad (x+\sqrt{a}) \cdot (x-\sqrt{a})$$

Expr1 is factored as much as possible toward real factors that are linear in *Var*, even if it introduces irrational constants or subexpressions that are irrational in other variables.

The factors and their terms are sorted with *Var* as the main variable. Similar powers of *Var* are collected in each factor. Include *Var* if factorization is needed with respect to only that variable and you are willing to accept irrational expressions in any other variables to increase factorization with respect to *Var*. There might be some incidental factoring with respect to other variables.

For the Auto setting of the **Auto or Approximate** mode, including *Var* permits approximation with floating-point coefficients where irrational coefficients cannot be explicitly expressed concisely in terms of the built-in functions. Even when there is only one variable, including *Var* might yield more complete factorization.

$$\text{factor}\left(x^5+4 \cdot x^4+5 \cdot x^3-6 \cdot x-3\right)$$
$$x^5+4 \cdot x^4+5 \cdot x^3-6 \cdot x-3$$
$$\text{factor}\left(x^5+4 \cdot x^4+5 \cdot x^3-6 \cdot x-3, x\right)$$
$$(x-0.964673) \cdot (x+0.611649) \cdot (x+2.12543) \cdot (x^{\blacktriangleright}$$

factor()	Catalog > 📖

Note: See also **comDenom()** for a fast way to achieve partial factoring when **factor()** is not fast enough or if it exhausts memory.

Note: See also **cFactor()** for factoring all the way to complex coefficients in pursuit of linear factors.

factor(*rationalNumber***)** returns the rational number factored into primes. For composite numbers, the computing time grows exponentially with the number of digits in the second-largest factor. For example, factoring a 30-digit integer could take more than a day, and factoring a 100-digit number could take more than a century.

To stop a calculation manually,

- **Handheld:** Hold down the ⌂ on key and press enter repeatedly.
- **Windows®:** Hold down the **F12** key and press **Enter** repeatedly.
- **Macintosh®:** Hold down the **F5** key and press **Enter** repeatedly.
- **iPad®:** The app displays a prompt. You can continue waiting or cancel.

If you merely want to determine if a number is prime, use **isPrime()** instead. It is much faster, particularly if *rationalNumber* is not prime and if the second-largest factor has more than five digits.

$$\text{factor}(152417172689) \qquad 123457 \cdot 1234577$$
$$\text{isPrime}(152417172689) \qquad \text{false}$$

FCdf()	Catalog > 📖

FCdf
(*lowBound***,***upBound***,***dfNumer***,***dfDenom***)** ⇒ *number* if *lowBound* and *upBound* are numbers, *list* if *lowBound* and *upBound* are lists

FCdf
(*lowBound***,***upBound***,***dfNumer***,***dfDenom***)** ⇒ *number* if *lowBound* and *upBound* are numbers, *list* if *lowBound* and *upBound* are lists

FCdf()	**Catalog >** 📖

Computes the F distribution probability between *lowBound* and *upBound* for the specified *dfNumer* (degrees of freedom) and *dfDenom*.

For P($X \leq upBound$), set *lowBound* = 0.

Fill	**Catalog >** 📖

Fill *Expr, matrixVar* $\Rightarrow$ *matrix*

Replaces each element in variable *matrixVar* with *Expr*.

matrixVar must already exist.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \rightarrow amatrix \qquad \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$$

Fill 1.01,*amatrix*   *Done*

$amatrix \qquad \begin{bmatrix} 1.01 & 1.01 \\ 1.01 & 1.01 \end{bmatrix}$

Fill *Expr, listVar* $\Rightarrow$ *list*

Replaces each element in variable *listVar* with *Expr*.

listVar must already exist.

$\{1,2,3,4,5\} \rightarrow alist \qquad \{1,2,3,4,5\}$

Fill 1.01,*alist*   *Done*

$alist \qquad \{1.01,1.01,1.01,1.01,1.01\}$

FiveNumSummary	**Catalog >** 📖

FiveNumSummary *X*[,[*Freq*][,*Category*,*Include*]]

Provides an abbreviated version of the 1-variable statistics on list X. A summary of results is stored in the *stat.results* variable. (See page 176.)

X represents a list containing the data.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding X and Y data point. The default value is 1.

Category is a list of numeric category codes for the corresponding X data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

FiveNumSummary

An empty (void) element in any of the lists *X*, *Freq*, or *Category* results in a void for the corresponding element of all those lists. For more information on empty elements, see page 251.

Output variable	Description
stat.MinX	Minimum of x values.
stat.Q$_1$X	1st Quartile of x.
stat.MedianX	Median of x.
stat.Q$_3$X	3rd Quartile of x.
stat.MaxX	Maximum of x values.

floor()

floor(*Expr1***)** ⇒ *integer*

$$\text{floor}(-2.14) \qquad -3.$$

Returns the greatest integer that is ≤ the argument. This function is identical to **int()**.

The argument can be a real or a complex number.

floor(*List1***)** ⇒ *list*
floor(*Matrix1***)** ⇒ *matrix*

$$\text{floor}\left(\left\{\frac{3}{2}, 0, -5.3\right\}\right) \qquad \{1, 0, -6.\}$$

Returns a list or matrix of the floor of each element.

$$\text{floor}\left(\begin{bmatrix} 1.2 & 3.4 \\ 2.5 & 4.8 \end{bmatrix}\right) \qquad \begin{bmatrix} 1. & 3. \\ 2. & 4. \end{bmatrix}$$

Note: See also **ceiling()** and **int()**.

fMax()

fMax(*Expr, Var***)** ⇒ *Boolean expression*
fMax(*Expr***,** *Var***,***lowBound***)**

$$\text{fMax}\left(1-(x-a)^2-(x-b)^2, x\right) \qquad x=\frac{a+b}{2}$$

fMax(*Expr***,** *Var***,***lowBound***,***upBound***)**

$$\text{fMax}\left(.5 \cdot x^3 - x - 2, x\right) \qquad x=\infty$$

fMax(*Expr, Var***) |**
lowBound≤Var≤upBound

Returns a Boolean expression specifying candidate values of *Var* that maximize *Expr* or locate its least upper bound.

fMax()   Catalog > 📖

You can use the constraint ("|") operator to restrict the solution interval and/or specify other constraints.

$$\text{fMax}\left(0.5 \cdot x^3 - x - 2, x\right)|x \leq 1 \qquad x = -0.816497$$

For the Approximate setting of the **Auto or Approximate** mode, **fMax()** iteratively searches for one approximate local maximum. This is often faster, particularly if you use the "|" operator to constrain the search to a relatively small interval that contains exactly one local maximum.

Note: See also **fMin()** and **max()**.

fMin()   Catalog > 📖

fMin($Expr$, Var**)** $\Rightarrow$ *Boolean expression*

fMin($Expr$**,** Var**,***lowBound***)**

fMin($Expr$**,** Var**,***lowBound***,***upBound***)**

fMin($Expr$**,** Var**) |** *lowBound≤Var≤upBound*

$$\text{fMin}\left(1-(x-a)^2-(x-b)^2, x\right) \qquad x=-\infty \text{ or } x=\infty$$

$$\text{fMin}\left(0.5 \cdot x^3 - x - 2, x\right)|x \geq 1 \qquad x=1.$$

Returns a Boolean expression specifying candidate values of Var that minimize $Expr$ or locate its greatest lower bound.

You can use the constraint ("|") operator to restrict the solution interval and/or specify other constraints.

For the Approximate setting of the **Auto or Approximate** mode, **fMin()** iteratively searches for one approximate local minimum. This is often faster, particularly if you use the "|" operator to constrain the search to a relatively small interval that contains exactly one local minimum.

Note: See also **fMax()** and **min()**.

For *Var*, *Low*, *High* [, *Step*]
   Block
EndFor

Define g()=Func	*Done*
Local *tempsum*,*step*,*i*	
0→*tempsum*	
1→*step*	
For *i*,1,100,*step*	
tempsum+*i*→*tempsum*	
EndFor	
EndFunc	

Executes the statements in *Block*
iteratively for each value of *Var*, from *Low*
to *High*, in increments of *Step*.

g()	5050

Var must not be a system variable.

Step can be positive or negative. The
default value is 1.

Block can be either a single statement or a
series of statements separated with the ":"
character.

Note for entering the example: For
instructions on entering multi-line program
and function definitions, refer to the
Calculator section of your product
guidebook.

---

format()   **Catalog >**

format(*Expr*[, *formatString*]**) ⇒** *string*

format(1.234567,"f3")	"1.235"
format(1.234567,"s2")	"1.23ᴇ0"
format(1.234567,"e3")	"1.235ᴇ0"
format(1.234567,"g3")	"1.235"
format(1234.567,"g3")	"1,234.567"
format(1.234567,"g3,r:")	"1:235"

Returns *Expr* as a character string based on
the format template.

Expr must simplify to a number.

formatString is a string and must be in the
form: "F[n]", "S[n]", "E[n]", "G[n][c]",
where [ ] indicate optional portions.

F[n]: Fixed format. n is the number of digits
to display after the decimal point.

S[n]: Scientific format. n is the number of
digits to display after the decimal point.

E[n]: Engineering format. n is the number
of digits after the first significant digit. The
exponent is adjusted to a multiple of three,
and the decimal point is moved to the right
by zero, one, or two digits.

format()   Catalog > 📖

G[n][c]: Same as fixed format but also separates digits to the left of the radix into groups of three. c specifies the group separator character and defaults to a comma. If c is a period, the radix will be shown as a comma.

[Rc]: Any of the above specifiers may be suffixed with the Rc radix flag, where c is a single character that specifies what to substitute for the radix point.

fPart()   Catalog > 📖

fPart(*Expr1***)** ⇒ *expression*
fPart(*List1***)** ⇒ *list*
fPart(*Matrix1***)** ⇒ *matrix*

fPart(-1.234)	-0.234
fPart($\{1,-2.3,7.003\}$)	$\{0,-0.3,0.003\}$

Returns the fractional part of the argument.

For a list or matrix, returns the fractional parts of the elements.

The argument can be a real or a complex number.

FPdf()   Catalog > 📖

FPdf(*XVal***,***dfNumer***,***dfDenom***)** ⇒ *number*
if *XVal* is a number, *list* if *XVal* is a list

Computes the F distribution probability at *XVal* for the specified *dfNumer* (degrees of freedom) and *dfDenom*.

freqTable▶list()   Catalog > 📖

freqTable▶list(*List1***,***freqIntegerList***)** ⇒ *list*

freqTable▶list($\{1,2,3,4\},\{1,4,3,1\}$)	
	$\{1,2,2,2,2,3,3,3,4\}$
freqTable▶list($\{1,2,3,4\},\{1,4,0,1\}$)	
	$\{1,2,2,2,2,4\}$

Returns a list containing the elements from *List1* expanded according to the frequencies in *freqIntegerList*. This function can be used for building a frequency table for the Data & Statistics application.

List1 can be any valid list.

freqTable►list()

freqIntegerList must have the same dimension as *List1* and must contain non-negative integer elements only. Each element specifies the number of times the corresponding *List1* element will be repeated in the result list. A value of zero excludes the corresponding *List1* element.

Note: You can insert this function from the computer keyboard by typing **freqTable@>list(**...**)**.

Empty (void) elements are ignored. For more information on empty elements, see page 251.

frequency()

frequency(*List1*,*binsList***)** $\Rightarrow$ *list*

Returns a list containing counts of the elements in *List1*. The counts are based on ranges (bins) that you define in *binsList*.

If *binsList* is {b(1), b(2), ..., b(n)}, the specified ranges are {**?**≤b(1), b(1)<**?**≤b(2),...,b(n-1)<**?**≤b(n), b(n)>**?**}. The resulting list is one element longer than *binsList*.

Each element of the result corresponds to the number of elements from *List1* that are in the range of that bin. Expressed in terms of the **countIf()** function, the result is { countIf(list, **?**≤b(1)), countIf(list, b(1)<**?**≤b(2)), ..., countIf(list, b(n-1)<**?**≤b(n)), countIf(list, b(n)>**?**)}.

Elements of *List1* that cannot be "placed in a bin" are ignored. Empty (void) elements are also ignored. For more information on empty elements, see page 251.

Within the Lists & Spreadsheet application, you can use a range of cells in place of both arguments.

Note: See also **countIf()**, page 35.

$datalist := \{1,2,\mathbf{e},3,\pi,4,5,6,"hello",7\}$

$\{1,2,2.71828,3,3.14159,4,5,6,"hello",7\}$

$\text{frequency}(datalist,\{2.5,4.5\}) \qquad \{2,4,3\}$

Explanation of result:

2 elements from *Datalist* are ≤2.5

4 elements from *Datalist* are >2.5 and ≤4.5

3 elements from *Datalist* are >4.5

The element "hello" is a string and cannot be placed in any of the defined bins.

FTest_2Samp

Catalog > 📖

FTest_2Samp *List1*,*List2*[,*Freq1*[,*Freq2*
[,*Hypoth*]]]

FTest_2Samp *List1*,*List2*[,*Freq1*[,*Freq2*
[,*Hypoth*]]]

(Data list input)

FTest_2Samp *sx1*,*n1*,*sx2*,*n2*[,*Hypoth*]

FTest_2Samp *sx1*,*n1*,*sx2*,*n2*[,*Hypoth*]

(Summary stats input)

Performs a two-sample F test. A summary
of results is stored in the *stat.results*
variable. (See page 176.)

For H : σ1 > σ2, set *Hypoth*>0
For H$_a$: σ1 ≠ σ2 (default), set *Hypoth* =0
For H$_a$: σ1 < σ2, set *Hypoth*<0

For information on the effect of empty
elements in a list, see *Empty (Void)
Elements*, page 251.

Output variable	Description
stat.F	Calculated F statistic for the data sequence
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.dfNumer	numerator degrees of freedom = n1-1
stat.dfDenom	denominator degrees of freedom = n2-1
stat.sx1, stat.sx2	Sample standard deviations of the data sequences in *List 1* and *List 2*
stat.x1_bar stat.x2_bar	Sample means of the data sequences in *List 1* and *List 2*
stat.n1, stat.n2	Size of the samples

Func

Catalog > 📖

Func
   Block
EndFunc

Template for creating a user-defined
function.

Define a piecewise function:
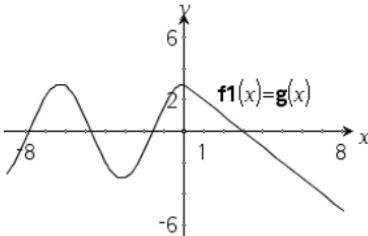

Alphabetical Listing 75

Func

Block can be a single statement, a series of statements separated with the ":" character, or a series of statements on separate lines. The function can use the **Return** instruction to return a specific result.

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

Define g(x)=Func   *Done*
    If x<0 Then
    Return 3·cos(x)
    Else
    Return 3−x
    EndIf
    EndFunc

Result of graphing g(x)

G

gcd()

gcd($Number1$, $Number2$**)** $\Rightarrow$ *expression*

Returns the greatest common divisor of the two arguments. The **gcd** of two fractions is the **gcd** of their numerators divided by the **lcm** of their denominators.

In Auto or Approximate mode, the **gcd** of fractional floating-point numbers is 1.0.

gcd(18,33)   3

gcd($List1$, $List2$**)** $\Rightarrow$ *list*

Returns the greatest common divisors of the corresponding elements in *List1* and *List2*.

gcd({12,14,16},{9,7,5})   {3,7,1}

gcd($Matrix1$, $Matrix2$**)** $\Rightarrow$ *matrix*

Returns the greatest common divisors of the corresponding elements in *Matrix1* and *Matrix2*.

$$\text{gcd}\left(\begin{bmatrix} 2 & 4 \\ 6 & 8 \end{bmatrix}, \begin{bmatrix} 4 & 8 \\ 12 & 16 \end{bmatrix}\right) \qquad \begin{bmatrix} 2 & 4 \\ 6 & 8 \end{bmatrix}$$

geomCdf()

geomCdf(p,$lowBound$,$upBound$**)** $\Rightarrow$ *number*

geomCdf()	**Catalog >** 📖

if *lowBound* and *upBound* are numbers, *list*
if *lowBound* and *upBound* are lists

geomCdf(*p*,*upBound***)**for P(1≤X≤*upBound*)
⇒ *number* if *upBound* is a number, *list* if
upBound is a list

Computes a cumulative geometric
probability from *lowBound* to *upBound* with
the specified probability of success *p*.

For P(X ≤ *upBound*), set *lowBound* = 1.

geomPdf()	**Catalog >** 📖

geomPdf(*p*,*XVal***)** ⇒ *number* if *XVal* is a
number, *list* if *XVal* is a list

Computes a probability at *XVal*, the number
of the trial on which the first success occurs,
for the discrete geometric distribution with
the specified probability of success p.

Get	**Hub Menu**

Get [*promptString*,] *var*[, *statusVar*]

Get [*promptString*,] *func***(***arg1*, ...*argn***)**
[, *statusVar*]

Programming command: Retrieves a value
from a connected TI-Innovator™ Hub and
assigns the value to variable *var*.

The value must be requested:

- In advance, through a **Send "READ ..."**
  command.

  — or —

- By embedding a **"READ ..."** request as
  the optional *promptString* argument.
  This method lets you use a single
  command to request the value and
  retrieve it.

Example: Request the current value of the
hub's built-in light-level sensor. Use **Get** to
retrieve the value and assign it to variable
lightval.

Send "READ BRIGHTNESS"	*Done*
Get *lightval*	*Done*
lightval	0.347922

Embed the READ request within the **Get**
command.

Get "READ BRIGHTNESS",*lightval*	*Done*
lightval	0.378441

Implicit simplification takes place. For example, a received string of "123" is interpreted as a numeric value. To preserve the string, use **GetStr** instead of **Get**.

If you include the optional argument *statusVar*, it is assigned a value based on the success of the operation. A value of zero means that no data was received.

In the second syntax, the *func*() argument allows a program to store the received string as a function definition. This syntax operates as if the program executed the command:

Define *func*(*arg1, ...argn*) = *received string*

The program can then use the defined function *func*().

Note: You can use the **Get** command within a user-defined program but not within a function.

Note: See also **GetStr**, page 84 and **Send**, page 158.

---

getDenom() Catalog > 📖

getDenom($Expr1$**)** ⇒ *expression*

Transforms the argument into an expression having a reduced common denominator, and then returns its denominator.

$$\text{getDenom}\left(\frac{x+2}{y-3}\right) \qquad y-3$$

$$\text{getDenom}\left(\frac{2}{7}\right) \qquad 7$$

$$\text{getDenom}\left(\frac{1}{x}+\frac{y^2+y}{y^2}\right) \qquad x\cdot y$$

---

getKey() Catalog > 📖

getKey([0|1]) ⇒ **returnString**

getKey()

Description:getKey() - allows a TI-Basic program to get keyboard input - handheld, desktop and emulator on desktop.

Example:

Example:

- keypressed := **getKey()** will return a key or an empty string if no key has been pressed. This call will return immediately.
- keypressed := **getKey(1)** will wait till a key is pressed. This call will pause execution of the program till a key is pressed.

Handling of key presses:

Handheld Device/Emulator Key	Desktop	Return Value
Esc	Esc	"esc"
Touchpad - Top click	n/a	"up"
On	n/a	"home"
Scratchapps	n/a	"scratchpad"
Touchpad - Left click	n/a	"left"
Touchpad - Center click	n/a	"center"
Touchpad - Right click	n/a	"right"
Doc	n/a	"doc"
Tab	Tab	"tab"
Touchpad - Bottom click	Down Arrow	"down"
Menu	n/a	"menu"
Ctrl	Ctrl	no return
Shift	Shift	no return
Var	n/a	"var"
Del	n/a	"del"
=	=	"="
trig	n/a	"trig"
0 through 9	0-9	"0" ... "9"

Handheld Device/Emulator Key	Desktop	Return Value
Templates	n/a	"template"
Catalog	n/a	"cat"
^	^	"^"
X^2	n/a	"square"
/ (division key)	/	"/"
* (multiply key)	*	"*"
e^x	n/a	"exp"
10^x	n/a	"10power"
+	+	"+"
-	-	"-"
(	(	"("
)	)	")"
.	.	"."
(-)	n/a	"-" (negate sign)
Enter	Enter	"enter"
ee	n/a	"E" (scientific notation E)
a - z	a-z	alpha = letter pressed (lower case) ("a" - "z")
shift a-z	shift a-z	alpha = letter pressed "A" - "Z"
		Note: ctrl-shift works to lock caps
?!	n/a	"?!"
pi	n/a	"pi"
Flag	n/a	no return
,	,	","
Return	n/a	"return"

Handheld Device/Emulator Key	Desktop	Return Value
Space	Space	" " (space)
Inaccessible	Special Character Keys like @,!,^, etc.	The character is returned
n/a	Function Keys	No returned character
n/a	Special desktop control keys	No returned character
Inaccessible	Other desktop keys that are not available on the calculator while getkey() is waiting for a keystroke. ({, },;, :, ...)	Same character you get in Notes (not in a math box)

Note: It is important to note that the presence of **getKey()** in a program changes how certain events are handled by the system. Some of these are described below.

Terminate program and Handle event - Exactly as if the user were to break out of program by pressing the **ON** key

"**Support**" below means - System works as expected - program continues to run.

Event	Device	Desktop - TI-Nspire™ Student Software
Quick Poll	Terminate program, handle event	Same as the handheld (TI-Nspire™ Student Software, TI-Nspire™ Navigator™ NC Teacher Software-only)
Remote file mgmt (Incl. sending 'Exit Press 2 Test' file from another handheld or desktop-handheld)	Terminate program, handle event	Same as the handheld. (TI-Nspire™ Student Software, TI-Nspire™ Navigator™ NC Teacher Software-only)
End Class	Terminate program, handle event	Support (TI-Nspire™ Student Software, TI-Nspire™ Navigator™ NC Teacher Software-only)

Event	Device	Desktop - TI-Nspire™ All Versions
TI-Innovator™ Hub connect/disconnect	Support - Can successfully issue commands to the TI-Innovator™ Hub. After you	Same as the handheld

exit the program the TI-Innovator™ Hub is still working with the handheld.

getLangInfo() Catalog > 📖

getLangInfo() ⇒ *string*

getLangInfo()	"en"

Returns a string that corresponds to the short name of the currently active language. You can, for example, use it in a program or function to determine the current language.

English = "en"
Danish = "da"
German = "de"
Finnish = "fi"
French = "fr"
Italian = "it"
Dutch = "nl"
Belgian Dutch = "nl_BE"
Norwegian = "no"
Portuguese = "pt"
Spanish = "es"
Swedish = "sv"

getLockInfo() Catalog > 📖

getLockInfo(*Var*) ⇒ *value*

Returns the current locked/unlocked state of variable *Var*.

value =0: *Var* is unlocked or does not exist.

value =1: *Var* is locked and cannot be modified or deleted.

See **Lock**, page 106, and **unLock**, page 197.

a:=65	65
Lock a	*Done*
getLockInfo(a)	1
a:=75	"Error: Variable is locked."
DelVar a	"Error: Variable is locked."
Unlock a	*Done*
a:=75	75
DelVar a	*Done*

getMode()

getMode(*ModeNameInteger***)** ⇒ *value*

getMode(0) ⇒ *list*

getMode(*ModeNameInteger***)** returns a value representing the current setting of the *ModeNameInteger* mode.

getMode(0) returns a list containing number pairs. Each pair consists of a mode integer and a setting integer.

For a listing of the modes and their settings, refer to the table below.

If you save the settings with **getMode(0)** → *var*, you can use **setMode(***var***)** in a function or program to temporarily restore the settings within the execution of the function or program only. See **setMode()**, page 162.

getMode(0)	
$\{1,7,2,1,3,1,4,1,5,1,6,1,7,1,8,1\}$	
getMode(1)	7
getMode(8)	1

Mode Name	Mode Integer	Setting Integers
Display Digits	1	**1**=Float, **2**=Float1, **3**=Float2, **4**=Float3, **5**=Float4, **6**=Float5, **7**=Float6, **8**=Float7, **9**=Float8, **10**=Float9, **11**=Float10, **12**=Float11, **13**=Float12, **14**=Fix0, **15**=Fix1, **16**=Fix2, **17**=Fix3, **18**=Fix4, **19**=Fix5, **20**=Fix6, **21**=Fix7, **22**=Fix8, **23**=Fix9, **24**=Fix10, **25**=Fix11, **26**=Fix12
Angle	2	**1**=Radian, **2**=Degree, **3**=Gradian
Exponential Format	3	**1**=Normal, **2**=Scientific, **3**=Engineering
Real or Complex	4	**1**=Real, **2**=Rectangular, **3**=Polar
Auto or Approx.	5	**1**=Auto, **2**=Approximate, **3**=Exact
Vector Format	6	**1**=Rectangular, **2**=Cylindrical, **3**=Spherical
Base	7	**1**=Decimal, **2**=Hex, **3**=Binary
Unit system	8	**1**=SI, **2**=Eng/US

getNum()

getNum(Expr1**)** ⇒ expression

Transforms the argument into an expression having a reduced common denominator, and then returns its numerator.

$$\text{getNum}\left(\frac{x+2}{y-3}\right) \qquad\qquad x+2$$

$$\text{getNum}\left(\frac{2}{7}\right) \qquad\qquad\qquad 2$$

$$\text{getNum}\left(\frac{1}{x}+\frac{1}{y}\right) \qquad\qquad x+y$$

GetStr

GetStr [promptString**,**] var[**,** statusVar]

GetStr [promptString**,**] func**(**arg1**,** ...argn**)** [**,** statusVar]

Programming command: Operates identically to the **Get** command, except that the retrieved value is always interpreted as a string. By contrast, the **Get** command interprets the response as an expression unless it is enclosed in quotation marks ("").

Note: See also **Get**, page 77 and **Send**, page 158.

For examples, see **Get**.

getType()

getType(var**)** ⇒ string

Returns a string that indicates the data type of variable var.

If var has not been defined, returns the string "NONE".

$\{1,2,3\} \to temp$	$\{1,2,3\}$
getType(temp)	"LIST"
$3 \cdot i \to temp$	$3 \cdot i$
getType(temp)	"EXPR"
DelVar temp	Done
getType(temp)	"NONE"

getVarInfo() ⇒ *matrix* or *string*

getVarInfo(*LibNameString***)** ⇒ *matrix* or *string*

getVarInfo() returns a matrix of information (variable name, type, library accessibility, and locked/unlocked state) for all variables and library objects defined in the current problem.

If no variables are defined, **getVarInfo()** returns the string "NONE".

getVarInfo(*LibNameString***)** returns a matrix of information for all library objects defined in library *LibNameString*. *LibNameString* must be a string (text enclosed in quotation marks) or a string variable.

If the library *LibNameString* does not exist, an error occurs.

Note the example, in which the result of **getVarInfo()** is assigned to variable *vs*. Attempting to display row 2 or row 3 of *vs* returns an "Invalid list or matrix" error because at least one of elements in those rows (variable *b*, for example) revaluates to a matrix.

This error could also occur when using *Ans* to reevaluate a **getVarInfo()** result.

The system gives the above error because the current version of the software does not support a generalized matrix structure where an element of a matrix can be either a matrix or a list.

getVarInfo()	"NONE"
Define $x=5$	*Done*
Lock x	*Done*
Define LibPriv $y=\{1,2,3\}$	*Done*
Define LibPub $z(x)=3{\cdot}x^2{-}x$	*Done*
getVarInfo()	$\begin{bmatrix} x & "NUM" & "\square" & 1 \\ y & "LIST" & "LibPriv " & 0 \\ z & "FUNC" & "LibPub " & 0 \end{bmatrix}$
getVarInfo(*tmp3*)	"Error: Argument must be a string"
getVarInfo("tmp3")	$\begin{bmatrix} volcyl2 & "NONE" & "LibPub " & 0 \end{bmatrix}$

$a:=1$	1
$b:=\begin{bmatrix} 1 & 2 \end{bmatrix}$	$\begin{bmatrix} 1 & 2 \end{bmatrix}$
$c:=\begin{bmatrix} 1 & 3 & 7 \end{bmatrix}$	$\begin{bmatrix} 1 & 3 & 7 \end{bmatrix}$
$vs:=$getVarInfo()	$\begin{bmatrix} a & "NUM" & "\square" & 0 \\ b & "MAT" & "\square" & 0 \\ c & "MAT" & "\square" & 0 \end{bmatrix}$
$vs[1]$	$\begin{bmatrix} 1 & "NUM" & "\square" & 0 \end{bmatrix}$
$vs[1,1]$	1
$vs[2]$	"Error: Invalid list or matrix"
$vs[2,1]$	$\begin{bmatrix} 1 & 2 \end{bmatrix}$

Goto

Catalog > 🗐🗐

Goto *labelName*

Transfers control to the label *labelName*.

labelName must be defined in the same function using a **Lbl** instruction.

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

Define *g*()=Func   *Done*
    Local *temp,i*
    0→*temp*
    1→*i*
    Lbl *top*
    temp+i→*temp*
    If *i*<10 Then
    i+1→*i*
    Goto *top*
    EndIf
    Return *temp*
    EndFunc

g()   55

►Grad

Catalog > 🗐🗐

Expr1►**Grad** ⇒ *expression*

Converts *Expr1* to gradian angle measure.

Note: You can insert this operator from the computer keyboard by typing **@>Grad**.

In Degree angle mode:

(1.5)►Grad $(1.66667)^g$

In Radian angle mode:

(1.5)►Grad $(95.493)^g$

I

identity()

Catalog > 🗐🗐

identity(*Integer***)** ⇒ *matrix*

Returns the identity matrix with a dimension of *Integer*.

Integer must be a positive integer.

identity(4) $\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$

If

Catalog > 🗐🗐

If *BooleanExpr*
    Statement

If *BooleanExpr* **Then**
    Block
EndIf

Define *g*(*x*)=Func   *Done*
    If *x*<0 Then
    Return *x*^{2}
    EndIf
    EndFunc

g(-2)   4

86 Alphabetical Listing

If *BooleanExpr* evaluates to true, executes the single statement *Statement* or the block of statements *Block* before continuing execution.

If *BooleanExpr* evaluates to false, continues execution without executing the statement or block of statements.

Block can be either a single statement or a sequence of statements separated with the ":" character.

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

If *BooleanExpr* **Then**
      Block1
Else
      Block2
EndIf

Define $g(x)$=Func	*Done*
If $x<0$ Then	
Return ^-x	
Else	
Return x	
EndIf	
EndFunc	
$g(12)$	12
$g(^-12)$	12

If *BooleanExpr* evaluates to true, executes *Block1* and then skips *Block2*.

If *BooleanExpr* evaluates to false, skips *Block1* but executes *Block2*.

Block1 and *Block2* can be a single statement.

If *BooleanExpr1* **Then**
      Block1
ElseIf *BooleanExpr2* **Then**
      Block2
⋮
ElseIf *BooleanExprN* **Then**
      BlockN
EndIf

Allows for branching. If *BooleanExpr1* evaluates to true, executes *Block1*. If *BooleanExpr1* evaluates to false, evaluates *BooleanExpr2*, and so on.

Define $g(x)$=Func	
If $x<^-5$ Then	
Return 5	
ElseIf $x>^-5$ and $x<0$ Then	
Return ^-x	
ElseIf $x≥0$ and $x≠10$ Then	
Return x	
ElseIf $x=10$ Then	
Return 3	
EndIf	
EndFunc	
	Done
$g(^-4)$	4
$g(10)$	3

ifFn(*BooleanExpr,Value_If_true* [,*Value_If_false* [,*Value_If_unknown*]]]) ⇒ *expression, list, or matrix*

Evaluates the boolean expression *BooleanExpr* (or each element from *BooleanExpr*) and produces a result based on the following rules:

- *BooleanExpr* can test a single value, a list, or a matrix.
- If an element of *BooleanExpr* evaluates to true, returns the corresponding element from *Value_If_true*.
- If an element of *BooleanExpr* evaluates to false, returns the corresponding element from *Value_If_false*. If you omit *Value_If_false*, returns undef.
- If an element of *BooleanExpr* is neither true nor false, returns the corresponding element *Value_If_unknown*. If you omit *Value_If_unknown*, returns undef.
- If the second, third, or fourth argument of the **ifFn()** function is a single expression, the Boolean test is applied to every position in *BooleanExpr*.

Note: If the simplified *BooleanExpr* statement involves a list or matrix, all other list or matrix arguments must have the same dimension(s), and the result will have the same dimension(s).

$$\text{ifFn}(\{1,2,3\}<2.5,\{5,6,7\},\{8,9,10\})$$
$$\{5,6,10\}$$

Test value of **1** is less than 2.5, so its corresponding

Value_If_True element of **5** is copied to the result list.

Test value of **2** is less than 2.5, so its corresponding

Value_If_True element of **6** is copied to the result list.

Test value of **3** is not less than 2.5, so its corresponding *Value_If_False* element of **10** is copied to the result list.

$$\text{ifFn}(\{1,2,3\}<2.5,4,\{8,9,10\}) \qquad \{4,4,10\}$$

Value_If_true is a single value and corresponds to any selected position.

$$\text{ifFn}(\{1,2,3\}<2.5,\{5,6,7\}) \qquad \{5,6,\text{undef}\}$$

Value_If_false is not specified. Undef is used.

$$\text{ifFn}(\{2,"a"\}<2.5,\{6,7\},\{9,10\},"err")$$
$$\{6,"err"\}$$

One element selected from *Value_If_true*. One element selected from *Value_If_unknown*.

---

imag() Catalog > 📖

imag(*Expr1***)** ⇒ *expression*

Returns the imaginary part of the argument.

$\text{imag}(1+2\cdot i)$	2
$\text{imag}(z)$	0
$\text{imag}(x+i\cdot y)$	y

imag()

Note: All undefined variables are treated as real variables. See also real(), page 146

imag(*List1***)** ⇒ *list*

$$\text{imag}\left(\left\{-3, 4-i, i\right\}\right) \qquad \left\{0, -1, 1\right\}$$

Returns a list of the imaginary parts of the elements.

imag(*Matrix1***)** ⇒ *matrix*

$$\text{imag}\left(\begin{bmatrix} a & b \\ i \cdot c & i \cdot d \end{bmatrix}\right) \qquad \begin{bmatrix} 0 & 0 \\ c & d \end{bmatrix}$$

Returns a matrix of the imaginary parts of the elements.

impDif()

impDif(*Equation***,** *Var***,** *dependVar*[**,***Ord*]**)** ⇒ *expression*

$$\text{impDif}\left(x^2 + y^2 = 100, x, y\right) \qquad \frac{-x}{y}$$

where the order *Ord* defaults to 1.

Computes the implicit derivative for equations in which one variable is defined implicitly in terms of another.

Indirection

inString()

inString(*srcString***,** *subString*[**,** *Start*]**)** ⇒ *integer*

$$\text{inString}\left(\text{"Hello there"}, \text{"the"}\right) \qquad 7$$
$$\text{inString}\left(\text{"ABCEFG"}, \text{"D"}\right) \qquad 0$$

Returns the character position in string *srcString* at which the first occurrence of string *subString* begins.

Start, if included, specifies the character position within *srcString* where the search begins. Default = 1 (the first character of *srcString*).

If *srcString* does not contain *subString* or *Start* is > the length of *srcString*, returns zero.

int()	**Catalog >** 📖📄

int(*Expr***)** ⇒ *integer*

$\operatorname{int}(-2.5)$	$-3.$
$\operatorname{int}\left(\begin{bmatrix} -1.234 & 0 & 0.37 \end{bmatrix}\right)$	$\begin{bmatrix} -2. & 0 & 0. \end{bmatrix}$

int(*List1***)** ⇒ *list*
int(*Matrix1***)** ⇒ *matrix*

Returns the greatest integer that is less than or equal to the argument. This function is identical to **floor()**.

The argument can be a real or a complex number.

For a list or matrix, returns the greatest integer of each of the elements.

intDiv()	**Catalog >** 📖📄

intDiv(*Number1***,** *Number2***)** ⇒ *integer*
intDiv(*List1***,** *List2***)** ⇒ *list*
intDiv(*Matrix1***,** *Matrix2***)** ⇒ *matrix*

$\operatorname{intDiv}(-7,2)$	-3
$\operatorname{intDiv}(4,5)$	0
$\operatorname{intDiv}(\{12,-14,-16\},\{5,4,-3\})$	$\{2,-3,5\}$

Returns the signed integer part of (*Number1* ÷ *Number2*).

For lists and matrices, returns the signed integer part of (argument 1 ÷ argument 2) for each element pair.

integral	**See ∫(), page 221.**

interpolate ()	**Catalog >** 📖📄

interpolate(*xValue***,** *xList***,** *yList***,**
*yPrimeList***)** ⇒ *list*

This function does the following:

Differential equation:
$y'=-3 \cdot y + 6 \cdot t + 5$ and $y(0)=5$

$rk:=\operatorname{rk23}(-3 \cdot y + 6 \cdot t + 5, t, y, \{0, 10\}, 5, 1)$
$\begin{bmatrix} 0. & 1. & 2. & 3. & 4. \\ 5. & 3.19499 & 5.00394 & 6.99957 & 9.00593 & 1(\end{bmatrix}$ ▸

To see the entire result,
press ▲ and then use ◄ and ► to move the cursor.

interpolate ()

Given *xList*, *yList*=**f(***xList***)**, and
yPrimeList=**f'(***xList***)** for some unknown
function **f**, a cubic interpolant is used to
approximate the function **f** at *xValue*. It is
assumed that *xList* is a list of
monotonically increasing or decreasing
numbers, but this function may return a
value even when it is not. This function
walks through *xList* looking for an interval
[*xList*[i], *xList*[i+1]] that contains *xValue*.
If it finds such an interval, it returns an
interpolated value for **f(***xValue***)**; otherwise,
it returns **undef.**

xList, *yList*, and *yPrimeList* must be of
equal dimension ≥ 2 and contain
expressions that simplify to numbers.

xValue can be an undefined variable, a
number, or a list of numbers.

Use the interpolate() function to calculate the
function values for the xvaluelist:

$xvaluelist:=\text{seq}(i,i,0,10,0.5)$
$\{0,0.5,1.,1.5,2.,2.5,3.,3.5,4.,4.5,5.,5.5,6.,6.5,\blacktriangleright$

$xlist:=\text{mat}\blacktriangleright\text{list}(rk[1])$
$\{0.,1.,2.,3.,4.,5.,6.,7.,8.,9.,10.\}$

$ylist:=\text{mat}\blacktriangleright\text{list}(rk[2])$
$\{5.,3.19499,5.00394,6.99957,9.00593,10.9978\blacktriangleright$

$yprimelist:=-3\cdot y+6\cdot t+5|y=ylist \text{ and } t=xlist$
$\{-10.,1.41503,1.98819,2.00129,1.98221,2.006\blacktriangleright$

$\text{interpolate}(xvaluelist,xlist,ylist,yprimelist)$
$\{5.,2.67062,3.19499,4.02782,5.00394,6.00011\blacktriangleright$

invχ²()

invχ²(*Area***,***df***)**

invChi2(*Area***,***df***)**

Computes the Inverse cumulative χ^2 (chi-
square) probability function specified by
degree of freedom, *df* for a given *Area*
under the curve.

invF()

invF(*Area***,***dfNumer***,***dfDenom***)**

invF(*Area***,***dfNumer***,***dfDenom***)**

computes the Inverse cumulative F
distribution function specified by *dfNumer*
and *dfDenom* for a given *Area* under the
curve.

invBinom()

invBinom

(*CumulativeProb***,***NumTrials***,***Prob***,** *OutputForm***)**⇒ *scalar* or *matrix*

Inverse binomial. Given the number of trials (*NumTrials*) and the probability of success of each trial (*Prob*), this function returns the minimum number of successes, k, such that the value, k, is greater than or equal to the given cumulative probability (*CumulativeProb*).

OutputForm=**0**, displays result as a scalar (default).

OutputForm=**1**, displays result as a matrix.

Example: Mary and Kevin are playing a dice game. Mary has to guess the maximum number of times 6 shows up in 30 rolls. If the number 6 shows up that many times or less, Mary wins. Furthermore, the smaller the number that she guesses, the greater her winnings. What is the smallest number Mary can guess if she wants the probability of winning to be greater than 77%?

$$\text{invBinom}\left(0.77,30,\frac{1}{6}\right) \qquad 6$$

$$\text{invBinom}\left(0.77,30,\frac{1}{6},1\right) \qquad \begin{bmatrix} 5 & 0.616447 \\ 6 & 0.776537 \end{bmatrix}$$

invBinomN()

invBinomN(*CumulativeProb***,***Prob***,** *NumSuccess***,***OutputForm***)**⇒ *scalar* or *matrix*

Inverse binomial with respect to N. Given the probability of success of each trial (*Prob*), and the number of successes (*NumSuccess*), this function returns the minimum number of trials, N, such that the value, N, is less than or equal to the given cumulative probability (*CumulativeProb*).

OutputForm=**0**, displays result as a scalar (default).

OutputForm=**1**, displays result as a matrix.

Example: Monique is practicing goal shots for netball. She knows from experience that her chance of making any one shot is 70%. She plans to practice until she scores 50 goals. How many shots must she attempt to ensure that the probability of making at least 50 goals is more than 0.99?

$$\text{invBinomN}(0.01,0.7,49) \qquad 86$$

$$\text{invBinomN}(0.01,0.7,49,1)$$

$$\begin{bmatrix} 85 & 0.010451 \\ 86 & 0.00709 \end{bmatrix}$$

invNorm()

invNorm(*Area*[,μ[,σ]]**)**

Computes the inverse cumulative normal distribution function for a given *Area* under the normal distribution curve specified by μ and *σ*.

invt()

invt(*Area***,***df***)**

invt()	**Catalog >** 📖📘

Computes the inverse cumulative student-t probability function specified by degree of freedom, *df* for a given *Area* under the curve.

iPart()	**Catalog >** 📖📘

iPart(*Number***)** ⇒ *integer*
iPart(*List1***)** ⇒ *list*
iPart(*Matrix1***)** ⇒ *matrix*

Returns the integer part of the argument.

For lists and matrices, returns the integer part of each element.

The argument can be a real or a complex number.

$$\text{iPart}(\text{-}1.234) \qquad \text{-}1.$$
$$\text{iPart}\left(\left\{\frac{3}{2},\text{-}2.3,7.003\right\}\right) \qquad \{1,\text{-}2.,7.\}$$

irr()	**Catalog >** 📖📘

irr(*CF0,CFList* [,*CFFreq*]**)** ⇒ *value*

Financial function that calculates internal rate of return of an investment.

CF0 is the initial cash flow at time 0; it must be a real number.

CFList is a list of cash flow amounts after the initial cash flow CF0.

CFFreq is an optional list in which each element specifies the frequency of occurrence for a grouped (consecutive) cash flow amount, which is the corresponding element of *CFList*. The default is 1; if you enter values, they must be positive integers < 10,000.

Note: See also **mirr()**, page 115.

$$list1 := \{6000,\text{-}8000,2000,\text{-}3000\}$$
$$\{6000,\text{-}8000,2000,\text{-}3000\}$$
$$list2 := \{2,2,2,1\} \qquad \{2,2,2,1\}$$
$$\text{irr}(5000,list1,list2) \qquad \text{-}4.64484$$

isPrime()	**Catalog >** 📖📘

isPrime(*Number***)** ⇒ *Boolean constant expression*

$$\text{isPrime}(5) \qquad \text{true}$$
$$\text{isPrime}(6) \qquad \text{false}$$

isPrime()   Catalog > 📖

Returns true or false to indicate if *number* is a whole number ≥ 2 that is evenly divisible only by itself and 1.

If *Number* exceeds about 306 digits and has no factors ≤1021, **isPrime(***Number***)** displays an error message.

If you merely want to determine if *Number* is prime, use **isPrime()** instead of **factor()**. It is much faster, particularly if *Number* is not prime and has a second-largest factor that exceeds about five digits.

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

Function to find the next prime after a specified number:

Define *nextprim*(*n*)=Func	*Done*
Loop	
$n+1 \rightarrow n$	
If isPrime(*n*)	
Return *n*	
EndLoop	
EndFunc	
nextprim(7)	11

isVoid()   Catalog > 📖

isVoid(*Var***)** ⇒ *Boolean constant expression*
isVoid(*Expr***)** ⇒ *Boolean constant expression*
isVoid(*List***)** ⇒ *list of Boolean constant expressions*

Returns true or false to indicate if the argument is a void data type.

For more information on void elements, see page 251.

a:=_	_
isVoid(*a*)	true
isVoid({1,_,3})	{false,true,false}

L

Lbl	Catalog > ![]

Lbl *labelName*

Defines a label with the name *labelName* within a function.

You can use a **Goto** *labelName* instruction to transfer control to the instruction immediately following the label.

labelName must meet the same naming requirements as a variable name.

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

Define g()=Func	*Done*
Local *temp,i*	
0→*temp*	
1→*i*	
Lbl *top*	
temp+i→temp	
If *i*<10 Then	
i+1→*i*	
Goto *top*	
EndIf	
Return *temp*	
EndFunc	
g()	55

lcm()	Catalog > ![]

lcm(*Number1***,** *Number2***)** ⇒ *expression*
lcm(*List1***,** *List2***)** ⇒ *list*
lcm(*Matrix1***,** *Matrix2***)** ⇒ *matrix*

Returns the least common multiple of the two arguments. The **lcm** of two fractions is the **lcm** of their numerators divided by the **gcd** of their denominators. The **lcm** of fractional floating-point numbers is their product.

For two lists or matrices, returns the least common multiples of the corresponding elements.

lcm(6,9)	18
lcm$\left(\left\{\frac{1}{3},-14,16\right\},\left\{\frac{2}{15},7,5\right\}\right)$	$\left\{\frac{2}{3},14,80\right\}$

left()	Catalog > ![]

left(*sourceString*[**,** *Num*]**)** ⇒ *string*

Returns the leftmost *Num* characters contained in character string *sourceString*.

If you omit *Num*, returns all of *sourceString*.

left(*List1*[**,** *Num*]**)** ⇒ *list*

left("Hello",2)	"He"

left({1,3,-2,4},3)	{1,3,-2}

left()   Catalog > 📖

Returns the leftmost *Num* elements contained in *List1*.

If you omit *Num*, returns all of *List1*.

left(*Comparison***)** ⇒ *expression*

$$\text{left}(x<3) \qquad\qquad\qquad\qquad\qquad x$$

Returns the left-hand side of an equation or inequality.

libShortcut()   Catalog > 📖

libShortcut(*LibNameString***,**
ShortcutNameString
[**,** *LibPrivFlag*]**)** ⇒ *list of variables*

Creates a variable group in the current problem that contains references to all the objects in the specified library document *libNameString*. Also adds the group members to the Variables menu. You can then refer to each object using its *ShortcutNameString*.

Set *LibPrivFlag*=**0** to exclude private library objects (default)
Set *LibPrivFlag*=**1** to include private library objects

To copy a variable group, see **CopyVar** on page 29.
To delete a variable group, see **DelVar** on page 48.

This example assumes a properly stored and refreshed library document named **linalg2** that contains objects defined as *clearmat*, *gauss1*, and *gauss2*.

$$\text{getVarInfo}("linalg2")$$
$$\begin{bmatrix} clearmat & "FUNC" & "LibPub " \\ gauss1 & "PRGM" & "LibPriv " \\ gauss2 & "FUNC" & "LibPub " \end{bmatrix}$$

$$\text{libShortcut}("linalg2","la")$$
$$\{la.clearmat,la.gauss2\}$$

$$\text{libShortcut}("linalg2","la",1)$$
$$\{la.clearmat,la.gauss1,la.gauss2\}$$

limit() or lim()   Catalog > 📖

limit(*Expr1***,** *Var***,** *Point* [**,***Direction*]**)** ⇒
expression
limit(*List1***,** *Var***,** *Point* [**,** *Direction*]**)** ⇒
list
limit(*Matrix1***,** *Var***,** *Point* [**,** *Direction*]**)** ⇒
matrix

Returns the limit requested.

Note: See also **Limit template**, page 6.

Direction: negative=from left, positive=from right, otherwise=both. (If omitted, *Direction* defaults to both.)

$$\lim_{x\to5}(2\cdot x+3) \qquad\qquad\qquad 13$$

$$\lim_{x\to0^+}\left(\frac{1}{x}\right) \qquad\qquad\qquad \infty$$

$$\lim_{x\to0}\left(\frac{\sin(x)}{x}\right) \qquad\qquad\qquad 1$$

$$\lim_{h\to0}\left(\frac{\sin(x+h)-\sin(x)}{h}\right) \qquad \cos(x)$$

$$\lim_{n\to\infty}\left(\left(1+\frac{1}{n}\right)^n\right) \qquad\qquad e$$

limit() or lim()

Limits at positive ∞ and at negative ∞ are always converted to one-sided limits from the finite side.

Depending on the circumstances, **limit()** returns itself or undef when it cannot determine a unique limit. This does not necessarily mean that a unique limit does not exist. undef means that the result is either an unknown number with finite or infinite magnitude, or it is the entire set of such numbers.

limit() uses methods such as L'Hopital's rule, so there are unique limits that it cannot determine. If *Expr1* contains undefined variables other than *Var*, you might have to constrain them to obtain a more concise result.

$$\lim_{x \to \infty} \left(a^x\right) \qquad \text{undef}$$

$$\lim_{x \to \infty} \left(a^x\right)|a>1 \qquad \infty$$

$$\lim_{x \to \infty} \left(a^x\right)|a>0 \text{ and } a<1 \qquad 0$$

Limits can be very sensitive to rounding error. When possible, avoid the Approximate setting of the **Auto or Approximate** mode and approximate numbers when computing limits. Otherwise, limits that should be zero or have infinite magnitude probably will not, and limits that should have finite non-zero magnitude might not.

LinRegBx

LinRegBx *X*,*Y*[,[*Freq*][,*Category*,*Include*]]

Computes the linear regression y = a+b•x on lists *X* and *Y* with frequency *Freq*. A summary of results is stored in the *stat.results* variable. (See page 176.)

All the lists must have equal dimension except for *Include*.

X and *Y* are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding X and Y data point. The default value is 1. All elements must be integers ≥ 0.

Category is a list of category codes for the corresponding X and Y data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.RegEqn	Regression Equation: a+b•x
stat.a, stat.b	Regression coefficients
stat.r^2	Coefficient of determination
stat.r	Correlation coefficient
stat.Resid	Residuals from the regression
stat.XReg	List of data points in the modified *X List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.YReg	List of data points in the modified *Y List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.FreqReg	List of frequencies corresponding to *stat.XReg* and *stat.YReg*

LinRegMx *X*,*Y*[,[*Freq*][,*Category*,*Include*]]

Computes the linear regression y = m•x+b on lists X and Y with frequency *Freq*. A summary of results is stored in the *stat.results* variable. (See page 176.)

All the lists must have equal dimension except for *Include*.

X and *Y* are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding *X* and *Y* data point. The default value is 1. All elements must be integers ≥ 0.

Category is a list of category codes for the corresponding *X* and *Y* data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.RegEqn	Regression Equation: y = m•x+b
stat.m, stat.b	Regression coefficients
stat.r^2	Coefficient of determination
stat.r	Correlation coefficient
stat.Resid	Residuals from the regression
stat.XReg	List of data points in the modified *X List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.YReg	List of data points in the modified *Y List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.FreqReg	List of frequencies corresponding to *stat.XReg* and *stat.YReg*

LinRegtIntervals   **Catalog >** 📖

LinRegtIntervals *X*,*Y*[,*F*[,**0**[,*CLev*]]]

For Slope. Computes a level C confidence interval for the slope.

LinRegtIntervals *X*,*Y*[,*F*[,**1**,*Xval*[,*CLev*]]]

For Response. Computes a predicted y-value, a level C prediction interval for a single observation, and a level C confidence interval for the mean response.

A summary of results is stored in the *stat.results* variable. (See page 176.)

All the lists must have equal dimension.

X and Y are lists of independent and dependent variables.

F is an optional list of frequency values. Each element in F specifies the frequency of occurrence for each corresponding X and Y data point. The default value is 1. All elements must be integers ≥ 0.

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.RegEqn	Regression Equation: a+b•x
stat.a, stat.b	Regression coefficients
stat.df	Degrees of freedom
stat.r^2	Coefficient of determination
stat.r	Correlation coefficient
stat.Resid	Residuals from the regression

For Slope type only

Output variable	Description
[stat.CLower, stat.CUpper]	Confidence interval for the slope
stat.ME	Confidence interval margin of error
stat.SESlope	Standard error of slope
stat.s	Standard error about the line

For Response type only

Output variable	Description
[stat.CLower, stat.CUpper]	Confidence interval for the mean response

Output variable	Description
stat.ME	Confidence interval margin of error
stat.SE	Standard error of mean response
[stat.LowerPred, stat.UpperPred]	Prediction interval for a single observation
stat.MEPred	Prediction interval margin of error
stat.SEPred	Standard error for prediction
stat.$\hat{y}$	a + b•XVal

LinRegtTest

LinRegtTest *X*,*Y*[,*Freq*[,*Hypoth*]]

Computes a linear regression on the *X* and *Y* lists and a *t* test on the value of slope β and the correlation coefficient ρ for the equation $y=\alpha+\beta x$. It tests the null hypothesis $H_0:\beta=0$ (equivalently, $\rho=0$) against one of three alternative hypotheses.

All the lists must have equal dimension.

X and *Y* are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding *X* and *Y* data point. The default value is 1. All elements must be integers ≥ 0.

Hypoth is an optional value specifying one of three alternative hypotheses against which the null hypothesis ($H_0:\beta=\rho=0$) will be tested.

For H_a: $\beta\neq0$ and $\rho\neq0$ (default), set *Hypoth*=0
For H_a: $\beta<0$ and $\rho<0$, set *Hypoth*<0
For H_a: $\beta>0$ and $\rho>0$, set *Hypoth*>0

A summary of results is stored in the *stat.results* variable. (See page 176.)

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.RegEqn	Regression equation: a + b•x
stat.t	*t*-Statistic for significance test
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.df	Degrees of freedom
stat.a, stat.b	Regression coefficients
stat.s	Standard error about the line
stat.SESlope	Standard error of slope
stat.r^2	Coefficient of determination
stat.r	Correlation coefficient
stat.Resid	Residuals from the regression

linSolve()   Catalog > 📖

linSolve(*SystemOfLinearEqns*, *Var1*, *Var2*, ...**)** ⇒ *list*

linSolve(*LinearEqn1* **and** *LinearEqn2* **and** *...*, *Var1*, *Var2*, ...**)** ⇒ *list*

linSolve({*LinearEqn1*, *LinearEqn2*, ...**},** *Var1*, *Var2*, ...**)** ⇒ *list*

linSolve(*SystemOfLinearEqns*, **{***Var1*, *Var2*, ...**})** ⇒ *list*

linSolve(*LinearEqn1* **and** *LinearEqn2* **and** *...*, **{***Var1*, *Var2*, ...**})** ⇒ *list*

linSolve({*LinearEqn1*, *LinearEqn2*, ...**},** **{***Var1*, *Var2*, ...**})** ⇒ *list*

Returns a list of solutions for the variables *Var1*, *Var2*, ...

The first argument must evaluate to a system of linear equations or a single linear equation. Otherwise, an argument error occurs.

For example, evaluating **linSolve(x=1 and x=2,x)** produces an "Argument Error" result.

$$\text{linSolve}\left(\left\{\begin{matrix}2 \cdot x + 4 \cdot y = 3 \\ 5 \cdot x - 3 \cdot y = 7\end{matrix}, \{x, y\}\right\}\right) \qquad \left\{\frac{37}{26}, \frac{1}{26}\right\}$$

$$\text{linSolve}\left(\left\{\begin{matrix}2 \cdot x = 3 \\ 5 \cdot x - 3 \cdot y = 7\end{matrix}, \{x, y\}\right\}\right) \qquad \left\{\frac{3}{2}, \frac{1}{6}\right\}$$

$$\text{linSolve}\left(\left\{\begin{matrix}apple + 4 \cdot pear = 23 \\ 5 \cdot apple - pear = 17\end{matrix}, \{apple, pear\}\right\}\right)$$
$$\left\{\frac{13}{3}, \frac{14}{3}\right\}$$

$$\text{linSolve}\left(\left\{\begin{matrix}apple \cdot 4 + \dfrac{pear}{3} = 14 \\ -apple + pear = 6\end{matrix}, \{apple, pear\}\right\}\right)$$
$$\left\{\frac{36}{13}, \frac{114}{13}\right\}$$

Δ**List(***List1***)** ⇒ *list*

$$\Delta\text{List}\big(\{20,30,45,70\}\big) \qquad \{10,15,25\}$$

Note: You can insert this function from the keyboard by typing **deltaList(**...**)**.

Returns a list containing the differences between consecutive elements in *List1*. Each element of *List1* is subtracted from the next element of *List1*. The resulting list is always one element shorter than the original *List1*.

---

list►mat()   **Catalog >** 🔢

list►mat(*List* [**,** *elementsPerRow*]**)** ⇒ *matrix*

$$\text{list}\blacktriangleright\text{mat}\big(\{1,2,3\}\big) \qquad \begin{bmatrix} 1 & 2 & 3 \end{bmatrix}$$

$$\text{list}\blacktriangleright\text{mat}\big(\{1,2,3,4,5\},2\big) \qquad \begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 0 \end{bmatrix}$$

Returns a matrix filled row-by-row with the elements from *List*.

elementsPerRow, if included, specifies the number of elements per row. Default is the number of elements in *List* (one row).

If *List* does not fill the resulting matrix, zeros are added.

Note: You can insert this function from the computer keyboard by typing **list@>mat (**...**)**.

►ln   **Catalog >** 🔢

Expr►**ln** ⇒ *expression*

$$\Big(\log_{10}(x)\Big)\blacktriangleright\ln \qquad \frac{\ln(x)}{\ln(10)}$$

Causes the input *Expr* to be converted to an expression containing only natural logs (ln).

Note: You can insert this operator from the computer keyboard by typing **@>ln**.

---

ln()   ctrl eˣ **keys**

ln(*Expr1***)** ⇒ *expression*

$$\ln(2.) \qquad 0.693147$$

ln(*List1***)** ⇒ *list*

If complex format mode is Real:

---

ln()

Returns the natural logarithm of the argument.

For a list, returns the natural logarithms of the elements.

$$\ln(\{-3,1.2,5\})$$
$$\text{"Error: Non−real calculation"}$$

If complex format mode is Rectangular:

$$\ln(\{-3,1.2,5\}) \quad \{\ln(3)+\pi\cdot i,0.182322,\ln(5)\}$$

ln(*squareMatrix1***)** $\Rightarrow$ *squareMatrix*

Returns the matrix natural logarithm of *squareMatrix1*. This is not the same as calculating the natural logarithm of each element. For information about the calculation method, refer to **cos()** on.

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

In Radian angle mode and Rectangular complex format:

$$\ln\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}$$
$$\begin{bmatrix} 1.83145+1.73485\cdot i & 0.009193-1.49086 \\ 0.448761-0.725533\cdot i & 1.06491+0.623491 \blacktriangleright \\ -0.266891-2.08316\cdot i & 1.12436+1.79018\cdot \end{bmatrix}$$

To see the entire result,
press ▲ and then use ◄ and ► to move the cursor.

LnReg   Catalog > 📖

LnReg *X*, *Y*[**,** [*Freq*] [**,** *Category*, *Include*]]

Computes the logarithmic regression y = a+b•ln(x) on lists *X* and *Y* with frequency *Freq*. A summary of results is stored in the *stat.results* variable. (See page 176.)

All the lists must have equal dimension except for *Include*.

X and *Y* are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding *X* and *Y* data point. The default value is 1. All elements must be integers ≥ 0.

Category is a list of category codes for the corresponding *X* and *Y* data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.RegEqn	Regression equation: a+b•ln(x)
stat.a, stat.b	Regression coefficients
stat.r^2	Coefficient of linear determination for transformed data
stat.r	Correlation coefficient for transformed data (ln(x), y)
stat.Resid	Residuals associated with the logarithmic model
stat.ResidTrans	Residuals associated with linear fit of transformed data
stat.XReg	List of data points in the modified *X List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.YReg	List of data points in the modified *Y List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.FreqReg	List of frequencies corresponding to *stat.XReg* and *stat.YReg*

Local *Var1*[**,** *Var2*] [**,** *Var3*] ...

Declares the specified *vars* as local variables. Those variables exist only during evaluation of a function and are deleted when the function finishes execution.

Note: Local variables save memory because they only exist temporarily. Also, they do not disturb any existing global variable values. Local variables must be used for **For** loops and for temporarily saving values in a multi-line function since modifications on global variables are not allowed in a function.

Define *rollcount*()=Func
    Local *i*
    1→*i*
    Loop
    If randInt(1,6)=randInt(1,6)
    Goto *end*
    i+1→*i*
    EndLoop
    Lbl *end*
    Return *i*
    EndFunc
                      Done

rollcount()   16

rollcount()   3

Local

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

Lock

Lock *Var1*[**,** *Var2*] [**,** *Var3*] ...
Lock *Var*.

Locks the specified variables or variable group. Locked variables cannot be modified or deleted.

You cannot lock or unlock the system variable *Ans*, and you cannot lock the system variable groups *stat.* or *tvm.*

Note: The **Lock** command clears the Undo/Redo history when applied to unlocked variables.

See **unLock**, page 197, and **getLockInfo()**, page 82.

a:=65	65
Lock a	*Done*
getLockInfo(a)	1
a:=75	"Error: Variable is locked."
DelVar a	"Error: Variable is locked."
Unlock a	*Done*
a:=75	75
DelVar a	*Done*

log()

log(*Expr1*[**,***Expr2*]**)** $\Rightarrow$ *expression*

log(*List1*[**,***Expr2*]**)** $\Rightarrow$ *list*

Returns the base-*Expr2* logarithm of the first argument.

Note: See also **Log template**, page 2.

For a list, returns the base-*Expr2* logarithm of the elements.

If the second argument is omitted, 10 is used as the base.

$\log_{10}(2.)$	0.30103
$\log_{4}(2.)$	0.5
$\log_{3}(10) - \log_{3}(5)$	$\log_{3}(2)$

If complex format mode is Real:

$$\log_{10}(\{-3,1.2,5\}) \quad \text{Error:} Non-\text{real } result$$

If complex format mode is Rectangular:

$$\log_{10}(\{-3,1.2,5\})$$
$$\left\{\log_{10}(3)+1.36438\cdot\boldsymbol{i},0.079181,\log_{10}(5)\right\}$$

log()

log(_squareMatrix1_[**,**_Expr_]**)** ⇒ _squareMatrix_

Returns the matrix base-_Expr_ logarithm of _squareMatrix1_. This is not the same as calculating the base-_Expr_ logarithm of each element. For information about the calculation method, refer to **cos()**.

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

If the base argument is omitted, 10 is used as base.

In Radian angle mode and Rectangular complex format:

$$\log_{10}\left(\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}\right)$$

$$\begin{bmatrix} 0.795387+0.753438 \cdot i & 0.003993-0.6474\ldots \\ 0.194895-0.315095 \cdot i & 0.462485+0.2707\ldots \\ -0.115909-0.904706 \cdot i & 0.488304+0.7774\ldots \end{bmatrix}$$

To see the entire result,
press ▲ and then use ◄ and ► to move the cursor.

►logbase

Catalog > 📖

Expr►**logbase(**_Expr1_**)** ⇒ _expression_

Causes the input Expression to be simplified to an expression using base _Expr1_.

Note: You can insert this operator from the computer keyboard by typing **@>logbase (...)** .

$$\log_3(10)-\log_5(5) \blacktriangleright \text{logbase}(5) \qquad \frac{\log_5\left(\frac{10}{3}\right)}{\log_5(3)}$$

Logistic

Catalog > 📖

Logistic _X_**,** _Y_[**,** [_Freq_] [**,** _Category_**,** _Include_]]

Computes the logistic regression $y = (c/(1+a \bullet e^{-bx}))$ on lists _X_ and _Y_ with frequency _Freq_. A summary of results is stored in the _stat.results_ variable. (See page 176.)

All the lists must have equal dimension except for _Include_.

_X_ and _Y_ are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in _Freq_ specifies the frequency of occurrence for each corresponding _X_ and _Y_ data point. The default value is 1. All elements must be integers ≥ 0.

Category is a list of category codes for the
corresponding *X* and *Y* data.

Include is a list of one or more of the
category codes. Only those data items
whose category code is included in this list
are included in the calculation.

For information on the effect of empty
elements in a list, see "Empty (Void)
Elements," page 251.

Output variable	Description
stat.RegEqn	Regression equation: $c/(1+a \cdot e^{-bx})$
stat.a, stat.b, stat.c	Regression coefficients
stat.Resid	Residuals from the regression
stat.XReg	List of data points in the modified *X List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.YReg	List of data points in the modified *Y List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.FreqReg	List of frequencies corresponding to *stat.XReg* and *stat.YReg*

LogisticD *X*, *Y* [, [*Iterations*] , [*Freq*] [,
Category, *Include*]]

Computes the logistic regression y = (c/
$(1+a \cdot e^{-bx})$+d) on lists *X* and *Y* with frequency
Freq, using a specified number of
Iterations. A summary of results is stored in
the *stat.results* variable. (See page 176.)

All the lists must have equal dimension
except for *Include*.

X and *Y* are lists of independent and
dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding X and Y data point. The default value is 1. All elements must be integers ≥ 0.

Category is a list of category codes for the corresponding X and Y data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.RegEqn	Regression equation: $c/(1+a \cdot e^{-bx})+d$
stat.a, stat.b, stat.c, stat.d	Regression coefficients
stat.Resid	Residuals from the regression
stat.XReg	List of data points in the modified X *List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.YReg	List of data points in the modified Y *List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.FreqReg	List of frequencies corresponding to *stat.XReg* and *stat.YReg*

Loop *Block* **EndLoop** Repeatedly executes the statements in *Block*. Note that the loop will be executed endlessly, unless a **Goto** or **Exit** instruction is executed within *Block*. *Block* is a sequence of statements separated with the ":" character. **Note for entering the example:** For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.	Define *rollcount*()=Func 　　Local *i* 　　1→*i* 　　Loop 　　If randInt(1,6)=randInt(1,6) 　　Goto *end* 　　*i*+1→*i* 　　EndLoop 　　Lbl *end* 　　Return *i* 　　EndFunc 　　　　　　　　　　　　　　*Done* *rollcount*()　　　　　　　　16 *rollcount*()　　　　　　　　　3

LU *Matrix*, *lMatrix*, *uMatrix*, *pMatrix* *[,Tol]*

Calculates the Doolittle LU (lower-upper) decomposition of a real or complex matrix. The lower triangular matrix is stored in *lMatrix*, the upper triangular matrix in *uMatrix*, and the permutation matrix (which describes the row swaps done during the calculation) in *pMatrix*.

lMatrix•uMatrix = pMatrix•matrix

Optionally, any matrix element is treated as zero if its absolute value is less than *Tol*. This tolerance is used only if the matrix has floating-point entries and does not contain any symbolic variables that have not been assigned a value. Otherwise, *Tol* is ignored.

- If you use `ctrl` `enter` or set the **Auto or Approximate** mode to Approximate, computations are done using floating-point arithmetic.
- If *Tol* is omitted or not used, the default tolerance is calculated as: 5E⁻14•max(dim(*Matrix*))•rowNorm (*Matrix*)

$$\begin{bmatrix} 6 & 12 & 18 \\ 5 & 14 & 31 \\ 3 & 8 & 18 \end{bmatrix} \rightarrow m1 \qquad \begin{bmatrix} 6 & 12 & 18 \\ 5 & 14 & 31 \\ 3 & 8 & 18 \end{bmatrix}$$

LU *m1,lower,upper,perm*	*Done*
lower	$\begin{bmatrix} 1 & 0 & 0 \\ \dfrac{5}{6} & 1 & 0 \\ \dfrac{1}{2} & \dfrac{1}{2} & 1 \end{bmatrix}$
upper	$\begin{bmatrix} 6 & 12 & 18 \\ 0 & 4 & 16 \\ 0 & 0 & 1 \end{bmatrix}$
perm	$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$

The **LU** factorization algorithm uses partial pivoting with row interchanges.

$$\begin{bmatrix} m & n \\ o & p \end{bmatrix} \rightarrow m1 \qquad\qquad \begin{bmatrix} m & n \\ o & p \end{bmatrix}$$

$$\text{LU } m1, lower, upper, perm \qquad\qquad Done$$

$$lower \qquad\qquad \begin{bmatrix} 1 & 0 \\ \dfrac{m}{o} & 1 \end{bmatrix}$$

$$upper \qquad\qquad \begin{bmatrix} o & p \\ 0 & n - \dfrac{m \cdot p}{o} \end{bmatrix}$$

$$perm \qquad\qquad \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$$

M

mat►list(*Matrix***)** ⇒ *list*

Returns a list filled with the elements in *Matrix*. The elements are copied from *Matrix* row by row.

$$\text{mat►list}\left(\begin{bmatrix} 1 & 2 & 3 \end{bmatrix}\right) \qquad\qquad \{1,2,3\}$$

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix} \rightarrow m1 \qquad\qquad \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$$

$$\text{mat►list}(m1) \qquad\qquad \{1,2,3,4,5,6\}$$

Note: You can insert this function from the computer keyboard by typing **mat@>list(**…**)**.

max(*Expr1***,** *Expr2***)** ⇒ *expression*

$$\max(2.3, 1.4) \qquad\qquad 2.3$$
$$\max(\{1,2\}, \{-4,3\}) \qquad\qquad \{1,3\}$$

max(*List1***,** *List2***)** ⇒ *list*
max(*Matrix1***,** *Matrix2***)** ⇒ *matrix*

Returns the maximum of the two arguments. If the arguments are two lists or matrices, returns a list or matrix containing the maximum value of each pair of corresponding elements.

max(*List***)** ⇒ *expression*

$$\max(\{0,1,-7,1.3,0.5\}) \qquad\qquad 1.3$$

Returns the maximum element in *list*.

max(*Matrix1***)** ⇒ *matrix*

$$\max\left(\begin{bmatrix} 1 & -3 & 7 \\ -4 & 0 & 0.3 \end{bmatrix}\right) \qquad \begin{bmatrix} 1 & 0 & 7 \end{bmatrix}$$

Returns a row vector containing the maximum element of each column in *Matrix1*.

max()

Empty (void) elements are ignored. For
more information on empty elements, see
page 251.

Note: See also **fMax() and min().**

mean()

mean($List$[**,** $freqList$]**)** ⇒ *expression*

Returns the mean of the elements in *List*.

Each *freqList* element counts the number
of consecutive occurrences of the
corresponding element in *List*.

$\text{mean}(\{0.2,0,1,-0.3,0.4\})$	0.26
$\text{mean}(\{1,2,3\},\{3,2,1\})$	$\dfrac{5}{3}$

mean($Matrix1$[**,** $freqMatrix$]**)** ⇒ *matrix*

Returns a row vector of the means of all
the columns in *Matrix1*.

Each *freqMatrix* element counts the
number of consecutive occurrences of the
corresponding element in *Matrix1*.

Empty (void) elements are ignored. For
more information on empty elements, see
page 251.

In Rectangular vector format:

$$\text{mean}\begin{bmatrix} 0.2 & 0 \\ -1 & 3 \\ 0.4 & -0.5 \end{bmatrix} \quad [-0.133333 \quad 0.833333]$$

$$\text{mean}\begin{bmatrix} \dfrac{1}{5} & 0 \\ -1 & 3 \\ \dfrac{2}{5} & \dfrac{-1}{2} \end{bmatrix} \quad \left[\dfrac{-2}{15} \quad \dfrac{5}{6}\right]$$

$$\text{mean}\left(\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix}, \begin{bmatrix} 5 & 3 \\ 4 & 1 \\ 6 & 2 \end{bmatrix}\right) \quad \left[\dfrac{47}{15} \quad \dfrac{11}{3}\right]$$

median()

median($List$[**,** $freqList$]**)** ⇒ *expression*

Returns the median of the elements in *List*.

Each *freqList* element counts the number
of consecutive occurrences of the
corresponding element in *List*.

$\text{median}(\{0.2,0,1,-0.3,0.4\})$	0.2

median($Matrix1$[**,** $freqMatrix$]**)** ⇒ *matrix*

Returns a row vector containing the
medians of the columns in *Matrix1*.

Each *freqMatrix* element counts the
number of consecutive occurrences of the
corresponding element in *Matrix1*.

$$\text{median}\begin{bmatrix} 0.2 & 0 \\ 1 & -0.3 \\ 0.4 & -0.5 \end{bmatrix} \quad [0.4 \quad -0.3]$$

| **median()** | **Catalog > **📖📄 |

Notes:

- All entries in the list or matrix must simplify to numbers.
- Empty (void) elements in the list or matrix are ignored. For more information on empty elements, see page 251.

| **MedMed** | **Catalog > **📖📄 |

MedMed *X,Y* [**,** *Freq*] [**,** *Category***,** *Include*]]

Computes the median-median line y = (m•x+b) on lists *X* and *Y* with frequency *Freq*. A summary of results is stored in the *stat.results* variable. (See page 176.)

All the lists must have equal dimension except for *Include*.

X and *Y* are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding *X* and *Y* data point. The default value is 1. All elements must be integers $\geq$ 0.

Category is a list of category codes for the corresponding *X* and *Y* data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.RegEqn	Median-median line equation: m•x+b
stat.m, stat.b	Model coefficients

Output variable	Description
stat.Resid	Residuals from the median-median line
stat.XReg	List of data points in the modified *X List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.YReg	List of data points in the modified *Y List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.FreqReg	List of frequencies corresponding to *stat.XReg* and *stat.YReg*

mid()	**Catalog >** 📖

mid(*sourceString***,** *Start*[**,** *Count*]**)** ⇒ *string*

Returns *Count* characters from character string *sourceString*, beginning with character number *Start*.

If *Count* is omitted or is greater than the dimension of *sourceString*, returns all characters from *sourceString*, beginning with character number *Start*.

Count must be ≥ 0. If *Count* = 0, returns an empty string.

mid("Hello there",2)	"ello there"
mid("Hello there",7,3)	"the"
mid("Hello there",1,5)	"Hello"
mid("Hello there",1,0)	"⬚"

mid(*sourceList***,** *Start* [**,** *Count*]**)** ⇒ *list*

Returns *Count* elements from *sourceList*, beginning with element number *Start*.

If *Count* is omitted or is greater than the dimension of *sourceList*, returns all elements from *sourceList*, beginning with element number *Start*.

Count must be ≥ 0. If Count = 0, returns an empty list.

mid({9,8,7,6},3)	{7,6}
mid({9,8,7,6},2,2)	{8,7}
mid({9,8,7,6},1,2)	{9,8}
mid({9,8,7,6},1,0)	{⬚}

mid(*sourceStringList***,** *Start*[**,** *Count*]**)** ⇒ *list*

Returns *Count* strings from the list of strings *sourceStringList*, beginning with element number *Start*.

mid({"A","B","C","D"},2,2)	
	{"B","C"}

min()	**Catalog >** 📖📷

min(*Expr1, Expr2***)** ⇒ *expression*

$$\min(2.3, 1.4) \qquad 1.4$$
$$\min(\{1,2\}, \{\text{-}4,3\}) \qquad \{\text{-}4,2\}$$

min(*List1, List2***)** ⇒ *list*
min(*Matrix1, Matrix2***)** ⇒ *matrix*

Returns the minimum of the two arguments. If the arguments are two lists or matrices, returns a list or matrix containing the minimum value of each pair of corresponding elements.

min(*List***)** ⇒ *expression*

$$\min(\{0,1,\text{-}7,1.3,0.5\}) \qquad \text{-}7$$

Returns the minimum element of *List*.

min(*Matrix1***)** ⇒ *matrix*

$$\min\left(\begin{bmatrix} 1 & \text{-}3 & 7 \\ \text{-}4 & 0 & 0.3 \end{bmatrix}\right) \qquad \begin{bmatrix} \text{-}4 & \text{-}3 & 0.3 \end{bmatrix}$$

Returns a row vector containing the minimum element of each column in *Matrix1*.

Note: See also **fMin()** and **max().**

mirr()	**Catalog >** 📖📷

mirr
(*financeRate,reinvestRate,CF0,CFList*[*,CFFreq*]**)**

$$list1 := \{6000, \text{-}8000, 2000, \text{-}3000\}$$
$$\{6000, \text{-}8000, 2000, \text{-}3000\}$$
$$list2 := \{2,2,2,1\} \qquad \{2,2,2,1\}$$
$$\text{mirr}(4.65, 12, 5000, list1, list2) \qquad 13.41608607$$

Financial function that returns the modified internal rate of return of an investment.

financeRate is the interest rate that you pay on the cash flow amounts.

reinvestRate is the interest rate at which the cash flows are reinvested.

CF0 is the initial cash flow at time 0; it must be a real number.

CFList is a list of cash flow amounts after the initial cash flow CF0.

CFFreq is an optional list in which each element specifies the frequency of occurrence for a grouped (consecutive) cash flow amount, which is the corresponding element of *CFList*. The default is 1; if you enter values, they must be positive integers < 10,000.

Note: See also **irr()**, page 93.

mod(*Expr1***,** *Expr2***)** ⇒ *expression*

$\mathrm{mod}(7,0)$	7
$\mathrm{mod}(7,3)$	1
$\mathrm{mod}(\text{-}7,3)$	2
$\mathrm{mod}(7,\text{-}3)$	-2
$\mathrm{mod}(\text{-}7,\text{-}3)$	-1
$\mathrm{mod}(\{12,\text{-}14,16\},\{9,7,\text{-}5\})$	$\{3,0,\text{-}4\}$

mod(*List1***,** *List2***)** ⇒ *list*
mod(*Matrix1***,** *Matrix2***)** ⇒ *matrix*

Returns the first argument modulo the second argument as defined by the identities:

mod(x,0) = x
mod(x,y) = x − y floor(x/y)

When the second argument is non-zero, the result is periodic in that argument. The result is either zero or has the same sign as the second argument.

If the arguments are two lists or two matrices, returns a list or matrix containing the modulo of each pair of corresponding elements.

Note: See also **remain()**, page 149

mRow(*Expr***,** *Matrix1***,** *Index***)** ⇒ *matrix*

$$\mathrm{mRow}\left(\frac{\text{-}1}{3},\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix},2\right) \qquad \begin{bmatrix} 1 & 2 \\ \text{-}1 & \dfrac{\text{-}4}{3} \end{bmatrix}$$

Returns a copy of *Matrix1* with each element in row *Index* of *Matrix1* multiplied by *Expr*.

mRowAdd(*Expr***,** *Matrix1***,** *Index1***,** *Index2***)** ⇒ *matrix*

$$\mathrm{mRowAdd}\left(\text{-}3,\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix},1,2\right) \qquad \begin{bmatrix} 1 & 2 \\ 0 & \text{-}2 \end{bmatrix}$$

$$\mathrm{mRowAdd}\left(n,\begin{bmatrix} a & b \\ c & d \end{bmatrix},1,2\right) \qquad \begin{bmatrix} a & b \\ a\cdot n+c & b\cdot n+d \end{bmatrix}$$

Returns a copy of *Matrix1* with each element in row *Index2* of *Matrix1* replaced with:

Expr • row *Index1* + row *Index2*

MultReg	Catalog > 📖

MultReg *Y*, *X1*[,*X2*[,*X3*,...[,*X10*]]]

Calculates multiple linear regression of list *Y* on lists *X1*, *X2*, ..., *X10*. A summary of results is stored in the *stat.results* variable. (See page 176.)

All the lists must have equal dimension.

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.RegEqn	Regression Equation: b0+b1•x1+b2•x2+ ...
stat.b0, stat.b1, ...	Regression coefficients
stat.R^2	Coefficient of multiple determination
stat.$\hat{y}$List	$\hat{y}$ List = b0+b1•x1+ ...
stat.Resid	Residuals from the regression

MultRegIntervals	Catalog > 📖

MultRegIntervals *Y*, *X1*[, *X2*[, *X3*,...[, *X10*]]], *XValList*[, *CLevel*]

Computes a predicted y-value, a level C prediction interval for a single observation, and a level C confidence interval for the mean response.

A summary of results is stored in the *stat.results* variable. (See page 176.)

All the lists must have equal dimension.

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.RegEqn	Regression Equation: b0+b1•x1+b2•x2+ ...
stat.$\hat{y}$	A point estimate: $\hat{y}$ = b0 + b1 • xl + ... for *XValList*
stat.dfError	Error degrees of freedom

Output variable	Description
stat.CLower, stat.CUpper	Confidence interval for a mean response
stat.ME	Confidence interval margin of error
stat.SE	Standard error of mean response
stat.LowerPred, stat.UpperrPred	Prediction interval for a single observation
stat.MEPred	Prediction interval margin of error
stat.SEPred	Standard error for prediction
stat.bList	List of regression coefficients, {b0,b1,b2,…}
stat.Resid	Residuals from the regression

MultRegTests   Catalog > 📖

MultRegTests Y**,** $X1$[**,** $X2$[**,** $X3$**,…**[**,** $X10$]]]

Multiple linear regression test computes a multiple linear regression on the given data and provides the global F test statistic and t test statistics for the coefficients.

A summary of results is stored in the *stat.results* variable. (See page 176.)

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Outputs

Output variable	Description
stat.RegEqn	Regression Equation: b0+b1•x1+b2•x2+ …
stat.F	Global F test statistic
stat.PVal	P-value associated with global F statistic
stat.R^2	Coefficient of multiple determination
stat.AdjR^2	Adjusted coefficient of multiple determination
stat.s	Standard deviation of the error
stat.DW	Durbin-Watson statistic; used to determine whether first-order auto correlation is present in the model

Output variable	Description
stat.dfReg	Regression degrees of freedom
stat.SSReg	Regression sum of squares
stat.MSReg	Regression mean square
stat.dfError	Error degrees of freedom
stat.SSError	Error sum of squares
stat.MSError	Error mean square
stat.bList	{b0,b1,...} List of coefficients
stat.tList	List of t statistics, one for each coefficient in the bList
stat.PList	List P-values for each t statistic
stat.SEList	List of standard errors for coefficients in bList
stat.$\hat{y}$List	$\hat{y}$ List = b0+b1•x1+ . . .
stat.Resid	Residuals from the regression
stat.sResid	Standardized residuals; obtained by dividing a residual by its standard deviation
stat.CookDist	Cook's distance; measure of the influence of an observation based on the residual and leverage
stat.Leverage	Measure of how far the values of the independent variable are from their mean values

N

nand	ctrl = keys

BooleanExpr1 **nand** *BooleanExpr2* returns *Boolean expression*
BooleanList1 **nand** *BooleanList2* returns *Boolean list*
BooleanMatrix1 **nand** *BooleanMatrix2* returns *Boolean matrix*

Returns the negation of a logical **and** operation on the two arguments. Returns true, false, or a simplified form of the equation.

For lists and matrices, returns comparisons element by element.

$x \geq 3$ and $x \geq 4$	$x \geq 4$
$x \geq 3$ nand $x \geq 4$	$x < 4$

nand   `ctrl` `=` **keys**

Integer1 **nand** *Integer2* ⇒ *integer*

Compares two real integers bit-by-bit using a **nand** operation. Internally, both integers are converted to signed, 64-bit binary numbers. When corresponding bits are compared, the result is 0 if both bits are 1; otherwise, the result is 1. The returned value represents the bit results, and is displayed according to the Base mode.

You can enter the integers in any number base. For a binary or hexadecimal entry, you must use the 0b or 0h prefix, respectively. Without a prefix, integers are treated as decimal (base 10).

3 and 4	0
3 nand 4	-1
$\{1,2,3\}$ and $\{3,2,1\}$	$\{1,2,1\}$
$\{1,2,3\}$ nand $\{3,2,1\}$	$\{-2,-3,-2\}$

nCr()   **Catalog >** 📖

nCr(*Expr1***,** *Expr2***)** ⇒ *expression*

For integer *Expr1* and *Expr2* with *Expr1* ≥ *Expr2* ≥ 0, **nCr()** is the number of combinations of *Expr1* things taken *Expr2* at a time. (This is also known as a binomial coefficient.) Both arguments can be integers or symbolic expressions.

nCr(*Expr***, 0)** ⇒ **1**

nCr(*Expr***,** *negInteger***)** ⇒ **0**

nCr(*Expr***,** *posInteger***)** ⇒ *Expr•***(***Expr−***1) ...** **(***Expr−posInteger***+1) /** *posInteger***!**

nCr(*Expr***,** *nonInteger***)** ⇒ *expression***! /** **((***Expr−nonInteger***)!•***nonInteger***!)**

$\text{nCr}(z,3)$	$\dfrac{z\cdot(z-2)\cdot(z-1)}{6}$
$Ans\lvert z=5$	10
$\text{nCr}(z,c)$	$\dfrac{z!}{c!\cdot(z-c)!}$
$\dfrac{Ans}{\text{nPr}(z,c)}$	$\dfrac{1}{c!}$

nCr(*List1***,** *List2***)** ⇒ *list*

Returns a list of combinations based on the corresponding element pairs in the two lists. The arguments must be the same size list.

$\text{nCr}(\{5,4,3\},\{2,4,2\})$	$\{10,1,3\}$

nCr(*Matrix1***,** *Matrix2***)** ⇒ *matrix*

$\text{nCr}\left(\begin{bmatrix}6 & 5\\4 & 3\end{bmatrix},\begin{bmatrix}2 & 2\\2 & 2\end{bmatrix}\right)$	$\begin{bmatrix}15 & 10\\6 & 3\end{bmatrix}$

nCr() ### Catalog >

Returns a matrix of combinations based on the corresponding element pairs in the two matrices. The arguments must be the same size matrix.

nDerivative() ### Catalog >

nDerivative($Expr1$**,**$Var=Value$**[,**$Order$**])**
$\Rightarrow value$

nDerivative($Expr1$**,**Var**[,**$Order$**])**
|$Var=Value \Rightarrow value$

Returns the numerical derivative calculated using auto differentiation methods.

When $Value$ is specified, it overrides any prior variable assignment or any current "|" substitution for the variable.

$Order$ of the derivative must be **1** or **2**.

$\text{nDerivative}(|x|,x=1)$	1
$\text{nDerivative}(|x|,x)|x=0$	undef
$\text{nDerivative}(\sqrt{x-1},x)|x=1$	undef

newList() ### Catalog >

newList($numElements$**)** $\Rightarrow list$

Returns a list with a dimension of $numElements$. Each element is zero.

$\text{newList}(4)$ $\{0,0,0,0\}$

newMat() ### Catalog >

newMat($numRows$**,** $numColumns$**)** $\Rightarrow$
matrix

Returns a matrix of zeros with the dimension $numRows$ by $numColumns$.

$\text{newMat}(2,3)$ $\begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$

nfMax() ### Catalog >

nfMax($Expr$**,** Var**)** $\Rightarrow value$
nfMax($Expr$**,** Var**,** $lowBound$**)** $\Rightarrow value$
nfMax($Expr$**,** Var**,** $lowBound$**,** $upBound$**)** $\Rightarrow$
value
nfMax($Expr$**,** Var**)** **|**
$lowBound \leq Var \leq upBound \Rightarrow value$

$\text{nfMax}(-x^2-2\cdot x-1,x)$	$-1.$
$\text{nfMax}(0.5\cdot x^3-x-2,x,-5,5)$	$5.$

nfMax()	**Catalog >** 📖📄

Returns a candidate numerical value of variable *Var* where the local maximum of *Expr* occurs.

If you supply *lowBound* and *upBound,* the function looks in the closed interval [*lowBound,upBound*] for the local maximum.

Note: See also **fMax()** and **d()**.

nfMin()	**Catalog >** 📖📄

nfMin(*Expr***,** *Var***)** ⇒ *value*
nfMin(*Expr***,** *Var, lowBound***)** ⇒ *value*
nfMin(*Expr***,** *Var, lowBound***,** *upBound***)** ⇒ *value*
nfMin(*Expr, Var***)** |
lowBound≤Var≤upBound ⇒ *value*

$$\text{nfMin}\left(x^2+2\cdot x+5,x\right) \qquad -1.$$

$$\text{nfMin}\left(0.5\cdot x^3-x-2,x,-5,5\right) \qquad -5.$$

Returns a candidate numerical value of variable *Var* where the local minimum of *Expr* occurs.

If you supply *lowBound* and *upBound,* the function looks in the closed interval [*lowBound,upBound*] for the local minimum.

Note: See also **fMin()** and **d()**.

nInt()	**Catalog >** 📖📄

nInt(*Expr1, Var, Lower, Upper***)** ⇒ *expression*

$$\text{nInt}\left(e^{-x^2},x,-1,1\right) \qquad 1.49365$$

If the integrand *Expr1* contains no variable other than *Var*, and if *Lower* and *Upper* are constants, positive ∞, or negative ∞, then **nInt()** returns an approximation of ∫ **(***Expr1*, *Var*, *Lower*, *Upper***)**. This approximation is a weighted average of some sample values of the integrand in the interval *Lower<Var<Upper*.

nInt()

The goal is six significant digits. The adaptive algorithm terminates when it seems likely that the goal has been achieved, or when it seems unlikely that additional samples will yield a worthwhile improvement.

$$\text{nInt}\big(\cos(x),x,-\pi,\pi+1.\text{E}-12\big) \qquad -1.04144\text{E}-12$$

$$\int_{-\pi}^{\pi+10^{-12}} \cos(x)\mathrm{d}x \qquad -\sin\!\left(\frac{1}{1000000000000}\right)$$

A warning is displayed ("Questionable accuracy") when it seems that the goal has not been achieved.

Nest **nInt()** to do multiple numeric integration. Integration limits can depend on integration variables outside them.

$$\text{nInt}\!\left(\text{nInt}\!\left(\frac{e^{-x\cdot y}}{\sqrt{x^2-y^2}},y,-x,x\right),x,0,1\right) \qquad 3.30423$$

Note: See also $\int$**()**, page 221.

nom()

nom($effectiveRate,CpY$**)** $\Rightarrow$ *value*

$$\text{nom}(5.90398,12) \qquad 5.75$$

Financial function that converts the annual effective interest rate *effectiveRate* to a nominal rate, given CpY as the number of compounding periods per year.

effectiveRate must be a real number, and CpY must be a real number > 0.

Note: See also **eff()**, page 58.

nor

BooleanExpr1 **nor** *BooleanExpr2* returns *Boolean expression*
BooleanList1 **nor** *BooleanList2* returns *Boolean list*
BooleanMatrix1 **nor** *BooleanMatrix2* returns *Boolean matrix*

$x\geq3$ or $x\geq4$	$x\geq3$
$x\geq3$ nor $x\geq4$	$x<3$

Returns the negation of a logical **or** operation on the two arguments. Returns true, false, or a simplified form of the equation.

For lists and matrices, returns comparisons element by element.

Integer1 **nor** *Integer2* ⇒ *integer*

Compares two real integers bit-by-bit using a **nor** operation. Internally, both integers are converted to signed, 64-bit binary numbers. When corresponding bits are compared, the result is 1 if both bits are 1; otherwise, the result is 0. The returned value represents the bit results, and is displayed according to the Base mode.

3 or 4	7
3 nor 4	-8
$\{1,2,3\}$ or $\{3,2,1\}$	$\{3,2,3\}$
$\{1,2,3\}$ nor $\{3,2,1\}$	$\{-4,-3,-4\}$

You can enter the integers in any number base. For a binary or hexadecimal entry, you must use the 0b or 0h prefix, respectively. Without a prefix, integers are treated as decimal (base 10).

---

norm()   **Catalog >** 📖

norm(*Matrix***)** ⇒ *expression*

norm(*Vector***)** ⇒ *expression*

Returns the Frobenius norm.

$\text{norm}\left(\begin{bmatrix} a & b \\ c & d \end{bmatrix}\right)$	$\sqrt{a^2+b^2+c^2+d^2}$
$\text{norm}\left(\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}\right)$	$\sqrt{30}$
$\text{norm}\left(\begin{bmatrix} 1 & 2 \end{bmatrix}\right)$	$\sqrt{5}$
$\text{norm}\left(\begin{bmatrix} 1 \\ 2 \end{bmatrix}\right)$	$\sqrt{5}$

---

normalLine()   **Catalog >** 📖

normalLine(*Expr1***,***Var***,***Point***)** ⇒ *expression*

normalLine(*Expr1***,***Var=Point***)** ⇒ *expression*

Returns the normal line to the curve represented by *Expr1* at the point specified in *Var=Point*.

Make sure that the independent variable is not defined. For example, If f1(x):=5 and x:=3, then **normalLine(**f1(x),x,2**)** returns "false."

$\text{normalLine}\left(x^2,x,1\right)$	$\dfrac{3}{2}-\dfrac{x}{2}$
$\text{normalLine}\left((x-3)^2-4,x,3\right)$	$x=3$
$\text{normalLine}\left(x^{\frac{1}{3}},x=0\right)$	0
$\text{normalLine}\left(\sqrt{\lvert x\rvert},x=0\right)$	undef

normCdf()   Catalog > 📖

normCdf(_lowBound_,_upBound_[,μ[,σ]]**)** ⇒ _number_ if _lowBound_ and _upBound_ are numbers, _list_ if _lowBound_ and _upBound_ are lists

Computes the normal distribution probability between _lowBound_ and _upBound_ for the specified μ (default=0) and σ (default=1).

For P(X ≤ _upBound_), set _lowBound_ = ⁻∞.

normPdf()   Catalog > 📖

normPdf(_XVal_[,μ[,σ]]**)** ⇒ _number_ if _XVal_ is a number, _list_ if _XVal_ is a list

Computes the probability density function for the normal distribution at a specified _XVal_ value for the specified μ and σ.

not   Catalog > 📖

not _BooleanExpr_ ⇒ _Boolean expression_

Returns true, false, or a simplified form of the argument.

not$(2 \geq 3)$	_true_
not$(x < 2)$	$x \geq 2$
not not _innocent_	_innocent_

not _Integer1_ ⇒ _integer_

Returns the one's complement of a real integer. Internally, _Integer1_ is converted to a signed, 64-bit binary number. The value of each bit is flipped (0 becomes 1, and vice versa) for the one's complement. Results are displayed according to the Base mode.

You can enter the integer in any number base. For a binary or hexadecimal entry, you must use the 0b or 0h prefix, respectively. Without a prefix, the integer is treated as decimal (base 10).

If you enter a decimal integer that is too large for a signed, 64-bit binary form, a symmetric modulo operation is used to bring the value into the appropriate range. For more information, see ▶**Base2**, page 17.

In Hex base mode:

Important: Zero, not the letter O.

not 0h7AC36	0hFFFFFFFFFFFF853C9

In Bin base mode:

0b100101▶Base10	37
not 0b100101	
0b1111111111111111111111111111111111111▶	
not 0b100101▶Base10	⁻38

To see the entire result,
press ▲ and then use ◄ and ▶ to move the cursor.

Note: A binary entry can have up to 64 digits (not counting the 0b prefix). A hexadecimal entry can have up to 16 digits.

nPr(*Expr1***,** *Expr2***)** ⇒ *expression*

For integer *Expr1* and *Expr2* with *Expr1* ≥ *Expr2* ≥ 0, **nPr()** is the number of permutations of *Expr1* things taken *Expr2* at a time. Both arguments can be integers or symbolic expressions.

$\mathrm{nPr}(z,3)$	$z\cdot(z-2)\cdot(z-1)$
$Ans\|z=5$	60
$\mathrm{nPr}(z,^-3)$	$\dfrac{1}{(z+1)\cdot(z+2)\cdot(z+3)}$
$\mathrm{nPr}(z,c)$	$\dfrac{z!}{(z-c)!}$
$Ans\cdot\mathrm{nPr}(z-c,^-c)$	1

nPr(*Expr***, 0** ⇒ **1**

nPr(*Expr***,** *negInteger***)** ⇒ **1 / ((***Expr***+1)•** **(***Expr***+2)** ... **(***expression−negInteger***))**

nPr(*Expr***,** *posInteger***)** ⇒ *Expr***•(***Expr***−1)** ... **(***Expr−posInteger***+1)**

nPr(*Expr***,** *nonInteger***)** ⇒ *Expr***! /** **(***Expr−nonInteger***)!**

nPr(*List1***,** *List2***)** ⇒ *list*

Returns a list of permutations based on the corresponding element pairs in the two lists. The arguments must be the same size list.

$\mathrm{nPr}(\{5,4,3\},\{2,4,2\})$	$\{20,24,6\}$

nPr(*Matrix1***,** *Matrix2***)** ⇒ *matrix*

Returns a matrix of permutations based on the corresponding element pairs in the two matrices. The arguments must be the same size matrix.

$\mathrm{nPr}\left(\begin{bmatrix} 6 & 5 \\ 4 & 3 \end{bmatrix},\begin{bmatrix} 2 & 2 \\ 2 & 2 \end{bmatrix}\right)$	$\begin{bmatrix} 30 & 20 \\ 12 & 6 \end{bmatrix}$

---

npv(*InterestRate***,***CFO***,***CFList***[,***CFFreq***])**

Financial function that calculates net present value; the sum of the present values for the cash inflows and outflows. A positive result for npv indicates a profitable investment.

InterestRate is the rate by which to discount the cash flows (the cost of money) over one period.

CF0 is the initial cash flow at time 0; it must be a real number.

CFList is a list of cash flow amounts after the initial cash flow *CF0*.

$list1:=\{6000,^-8000,2000,^-3000\}$	
	$\{6000,^-8000,2000,^-3000\}$
$list2:=\{2,2,2,1\}$	$\{2,2,2,1\}$
$\mathrm{npv}(10,5000,list1,list2)$	4769.91

CFFreq is a list in which each element specifies the frequency of occurrence for a grouped (consecutive) cash flow amount, which is the corresponding element of *CFList*. The default is 1; if you enter values, they must be positive integers < 10,000.

nSolve(*Equation***,***Var***[=***Guess***])** ⇒ *number or error_string*

nSolve(*Equation***,***Var***[=***Guess***],***lowBound***)** ⇒ *number or error_string*

nSolve(*Equation***,***Var* **[=***Guess***],***lowBound***,***upBound***)** ⇒ *number or error_string*

nSolve(*Equation***,***Var***[=***Guess***]) |** *lowBound≤Var≤upBound* ⇒ *number or error_string*

Iteratively searches for one approximate real numeric solution to *Equation* for its one variable. Specify the variable as:

variable
– or –
variable = real number

For example, x is valid and so is x=3.

nSolve() is often much faster than **solve()** or **zeros()**, particularly if the "**|**" operator is used to constrain the search to a small interval containing exactly one simple solution.

nSolve() attempts to determine either one point where the residual is zero or two relatively close points where the residual has opposite signs and the magnitude of the residual is not excessive. If it cannot achieve this using a modest number of sample points, it returns the string "no solution found."

$\text{nSolve}(x^2+5\cdot x-25=9,x)$	3.84429
$\text{nSolve}(x^2=4,x=-1)$	-2.
$\text{nSolve}(x^2=4,x=1)$	2.

Note: If there are multiple solutions, you can use a guess to help find a particular solution.

$\text{nSolve}(x^2+5\cdot x-25=9,x)\|x<0$	-8.84429
$\text{nSolve}\left(\dfrac{(1+r)^{24}-1}{r}=26,r\right)\|r>0 \text{ and } r<0.25$	
	0.006886
$\text{nSolve}(x^2=-1,x)$	"No solution found"

nSolve()	**Catalog >** 📖

Note: See also **cSolve()**, **cZeros()**, **solve()**, and **zeros()**.

O

OneVar	**Catalog >** 📖

OneVar [**1,**]*X*[**,**[*Freq*][**,***Category***,***Include*]]

OneVar [*n*,]*X1***,***X2*[*X3*[**,**…[**,***X20*]]]

Calculates 1-variable statistics on up to 20 lists. A summary of results is stored in the *stat.results* variable. (See page 176.)

All the lists must have equal dimension except for *Include*.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding X and Y data point. The default value is 1. All elements must be integers ≥ 0.

Category is a list of numeric category codes for the corresponding X values.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

An empty (void) element in any of the lists *X*, *Freq*, or *Category* results in a void for the corresponding element of all those lists. An empty element in any of the lists *X1* through *X20* results in a void for the corresponding element of all those lists. For more information on empty elements, see page 251.

Output variable	Description
stat.x̄	Mean of x values
stat.Σx	Sum of x values
stat.Σx²	Sum of x^2 values

Output variable	Description
stat.sx	Sample standard deviation of x
stat.σx	Population standard deviation of x
stat.n	Number of data points
stat.MinX	Minimum of x values
stat.Q$_1$X	1st Quartile of x
stat.MedianX	Median of x
stat.Q$_3$X	3rd Quartile of x
stat.MaxX	Maximum of x values
stat.SSX	Sum of squares of deviations from the mean of x

---

or   Catalog > 📖

BooleanExpr1 **or** *BooleanExpr2* returns *Boolean expression*
BooleanList1 **or** *BooleanList2* returns *Boolean list*
BooleanMatrix1 **or** *BooleanMatrix2* returns *Boolean matrix*

Returns true or false or a simplified form of the original entry.

Returns true if either or both expressions simplify to true. Returns false only if both expressions evaluate to false.

Note: See **xor**.

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

$x{\geq}3$ or $x{\geq}4$	$x{\geq}3$

Define $g(x)$=Func	*Done*
If $x{\leq}0$ or $x{\geq}5$	
Goto *end*	
Return $x{\cdot}3$	
Lbl *end*	
EndFunc	
$g(3)$	9
$g(0)$	*A function did* not return *a value*

Integer1 **or** *Integer2* $\Rightarrow$ *integer*

In Hex base mode:

0h7AC36 or 0h3D5F	0h7BD7F

Important: Zero, not the letter O.

In Bin base mode:

0b100101 or 0b100	0b100101

Compares two real integers bit-by-bit using an or operation. Internally, both integers are converted to signed, 64-bit binary numbers. When corresponding bits are compared, the result is 1 if either bit is 1; the result is 0 only if both bits are 0. The returned value represents the bit results, and is displayed according to the Base mode.

Note: A binary entry can have up to 64 digits (not counting the 0b prefix). A hexadecimal entry can have up to 16 digits.

You can enter the integers in any number base. For a binary or hexadecimal entry, you must use the 0b or 0h prefix, respectively. Without a prefix, integers are treated as decimal (base 10).

If you enter a decimal integer that is too large for a signed, 64-bit binary form, a symmetric modulo operation is used to bring the value into the appropriate range. For more information, see ►**Base2**, page 17.

Note: See **xor**.

---

ord($String$**)** ⇒ $integer$
ord($List1$**)** ⇒ $list$

Returns the numeric code of the first character in character string $String$, or a list of the first characters of each list element.

ord("hello")	104
char(104)	"h"
ord(char(24))	24
ord({"alpha","beta"})	{97,98}

P

P►Rx($rExpr$**,** θ$Expr$**)** ⇒ $expression$
P►Rx($rList$**,** θ$List$**)** ⇒ $list$
P►Rx($rMatrix$**,** θ$Matrix$**)** ⇒ $matrix$

Returns the equivalent x-coordinate of the (r, θ) pair.

In Radian angle mode:

P►Rx(r,θ)	$\cos(\theta)\cdot r$
P►Rx$(4,60°)$	2

$$P\blacktriangleright Rx\left(\{-3,10,1.3\},\left\{\frac{\pi}{3},\frac{-\pi}{4},0\right\}\right)$$
$$\left\{\frac{-3}{2},5\cdot\sqrt{2},1.3\right\}$$

P►Rx()   Catalog > 📖

Note: The θ argument is interpreted as either a degree, gradian or radian angle, according to the current angle mode. If the argument is an expression, you can use °, ^G, or ^r to override the angle mode setting temporarily.

Note: You can insert this function from the computer keyboard by typing **P@>Rx (**...**)** .

P►Ry()   Catalog > 📖

P►Ry($rExpr$**,** θ$Expr$**)** ⇒ *expression*

P►Ry($rList$**,** θ$List$**)** ⇒ *list*
P►Ry($rMatrix$**,** θ$Matrix$**)** ⇒ *matrix*

Returns the equivalent y-coordinate of the (r, θ) pair.

Note: The θ argument is interpreted as either a degree, radian or gradian angle, according to the current angle mode. If the argument is an expression, you can use °, ^G, or ^r to override the angle mode setting temporarily.

Note: You can insert this function from the computer keyboard by typing **P@>Ry (**...**)** .

In Radian angle mode:

$\text{P►Ry}(r,\theta)$	$\sin(\theta)\cdot r$
$\text{P►Ry}(4,60°)$	$2\cdot\sqrt{3}$

$$\text{P►Ry}\left(\{-3,10,1.3\},\left\{\frac{\pi}{3},\frac{-\pi}{4},0\right\}\right)$$
$$\left\{\frac{-3\cdot\sqrt{3}}{2},-5\cdot\sqrt{2},0.\right\}$$

PassErr   Catalog > 📖

PassErr

Passes an error to the next level.

If system variable *errCode* is zero, **PassErr** does not do anything.

The **Else** clause of the **Try...Else...EndTry** block should use **ClrErr** or **PassErr**. If the error is to be processed or ignored, use **ClrErr**. If what to do with the error is not known, use **PassErr** to send it to the next error handler. If there are no more pending **Try...Else...EndTry** error handlers, the error dialog box will be displayed as normal.

For an example of **PassErr**, See Example 2 under the **Try** command, page 191.

PassErr	**Catalog > 📘**

Note: See also **ClrErr**, page 25, and **Try**, page 191.

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

piecewise()	**Catalog > 📘**

piecewise($Expr1$[**,** $Cond1$[**,** $Expr2$ [**,** $Cond2$ [**,** …]]]]**)**

$$\text{Define } p(x) = \begin{cases} x, & x > 0 \\ \text{undef}, & x \leq 0 \end{cases} \qquad \textit{Done}$$

$$p(1) \qquad\qquad 1$$

$$p(-1) \qquad\qquad \text{undef}$$

Returns definitions for a piecewise function in the form of a list. You can also create piecewise definitions by using a template.

Note: See also **Piecewise template**, page 3.

poissCdf()	**Catalog > 📘**

poissCdf(λ**,**$lowBound$**,**$upBound$**)** $\Rightarrow$ *number* if $lowBound$ and $upBound$ are numbers, *list* if $lowBound$ and $upBound$ are lists

poissCdf(λ**,**$upBound$**)** for P(0$\leq$X$\leq$$upBound$) $\Rightarrow$ *number* if $upBound$ is a number, list if $upBound$ is a list

Computes a cumulative probability for the discrete Poisson distribution with specified mean λ.

For P(X $\leq$ $upBound$), set $lowBound$=0

poissPdf()	**Catalog > 📘**

poissPdf(λ**,**$XVal$**)** $\Rightarrow$ *number* if $XVal$ is a number, *list* if $XVal$ is a list

Computes a probability for the discrete Poisson distribution with the specified mean λ.

Vector ►**Polar**

Note: You can insert this operator from the computer keyboard by typing @>**Polar**.

Displays *vector* in polar form [r∠θ]. The vector must be of dimension 2 and can be a row or a column.

Note: ►**Polar** is a display-format instruction, not a conversion function. You can use it only at the end of an entry line, and it does not update *ans*.

Note: See also ►**Rect**, page 146.

$$[1 \quad 3.] \blacktriangleright \text{Polar} \qquad [3.16228 \quad \angle 1.24905]$$

$$[x \quad y] \blacktriangleright \text{Polar}$$
$$\left[\sqrt{x^2+y^2} \quad \angle \frac{\pi \cdot \text{sign}(y)}{2} - \tan^{-1}\left(\frac{x}{y}\right) \right]$$

complexValue ►**Polar**

Displays *complexVector* in polar form.

• Degree angle mode returns (r∠θ).

• Radian angle mode returns re^{iθ}.

complexValue can have any complex form. However, an re^{iθ} entry causes an error in Degree angle mode.

Note: You must use the parentheses for an (r∠θ) polar entry.

In Radian angle mode:

$$(3+4 \cdot i) \blacktriangleright \text{Polar} \qquad e^{i \cdot \left(\frac{\pi}{2} - \tan^{-1}\left(\frac{3}{4}\right)\right)} \cdot 5$$

$$\left(\left(4 \angle -\frac{\pi}{3}\right)\right) \blacktriangleright \text{Polar} \qquad e^{\frac{i \cdot \pi}{3}} \cdot 4$$

In Gradian angle mode:

$$(4 \cdot i) \blacktriangleright \text{Polar} \qquad (4\angle \ 100.)$$

In Degree angle mode:

$$(3+4 \cdot i) \blacktriangleright \text{Polar} \qquad \left(5 \ \angle \ 90 - \tan^{-1}\left(\frac{3}{4}\right)\right)$$

---

polyCoeffs() Catalog > 📖

polyCoeffs(*Poly* [,*Var*]**)** ⇒ *list*

$$\text{polyCoeffs}(4 \cdot x^2 - 3 \cdot x + 2, x) \qquad \{4, -3, 2\}$$

polyCoeffs()

Returns a list of the coefficients of polynomial *Poly* with respect to variable *Var*.

Poly must be a polynomial expression in *Var*. We recommend that you do not omit *Var* unless *Poly* is an expression in a single variable.

$$\text{polyCoeffs}\left((x-1)^2 \cdot (x+2)^3\right)$$
$$\{1,4,1,-10,-4,8\}$$

Expands the polynomial and selects *x* for the omitted *Var*.

$$\text{polyCoeffs}\left((x+y+z)^2, x\right)$$
$$\{1, 2 \cdot (y+z), (y+z)^2\}$$

$$\text{polyCoeffs}\left((x+y+z)^2, y\right)$$
$$\{1, 2 \cdot (x+z), (x+z)^2\}$$

$$\text{polyCoeffs}\left((x+y+z)^2, z\right)$$
$$\{1, 2 \cdot (x+y), (x+y)^2\}$$

polyDegree()

polyDegree(*Poly* [,*Var*]**)** ⇒ *value*

Returns the degree of polynomial expression *Poly* with respect to variable *Var*. If you omit *Var*, the **polyDegree()** function selects a default from the variables contained in the polynomial *Poly*.

Poly must be a polynomial expression in *Var*. We recommend that you do not omit *Var* unless *Poly* is an expression in a single variable.

$$\text{polyDegree}(5) \qquad 0$$
$$\text{polyDegree}(\ln(2)+\pi, x) \qquad 0$$

Constant polynomials

$$\text{polyDegree}(4 \cdot x^2 - 3 \cdot x + 2, x) \qquad 2$$
$$\text{polyDegree}\left((x-1)^2 \cdot (x+2)^3\right) \qquad 5$$

$$\text{polyDegree}\left((x+y^2+z^3)^2, x\right) \qquad 2$$
$$\text{polyDegree}\left((x+y^2+z^3)^2, y\right) \qquad 4$$

$$\text{polyDegree}\left((x-1)^{10000}, x\right) \qquad 10000$$

The degree can be extracted even though the coefficients cannot. This is because the degree can be extracted without expanding the polynomial.

polyEval()

polyEval(_List1_**,** _Expr1_**)** ⇒ _expression_
polyEval(_List1_**,** _List2_**)** ⇒ _expression_

Interprets the first argument as the coefficient of a descending-degree polynomial, and returns the polynomial evaluated for the value of the second argument.

$\text{polyEval}(\{a,b,c\},x)$	$a\cdot x^2+b\cdot x+c$
$\text{polyEval}(\{1,2,3,4\},2)$	26
$\text{polyEval}(\{1,2,3,4\},\{2,\text{-}7\})$	$\{26,\text{-}262\}$

polyGcd()

polyGcd(_Expr1_**,**_Expr2_**)** ⇒ _expression_

Returns greatest common divisor of the two arguments.

Expr1 and _Expr2_ must be polynomial expressions.

List, matrix, and Boolean arguments are not allowed.

$\text{polyGcd}(100,30)$	10
$\text{polyGcd}(x^2-1,x-1)$	$x-1$
$\text{polyGcd}(x^3-6\cdot x^2+11\cdot x-6,x^2-6\cdot x+8)$	
	$x-2$

polyQuotient()

polyQuotient(_Poly1_**,**_Poly2_ [,_Var_]**)** ⇒ _expression_

Returns the quotient of polynomial _Poly1_ divided by polynomial _Poly2_ with respect to the specified variable _Var_.

Poly1 and _Poly2_ must be polynomial expressions in _Var_. We recommend that you do not omit _Var_ unless _Poly1_ and _Poly2_ are expressions in the same single variable.

$\text{polyQuotient}(x-1,x-3)$	1
$\text{polyQuotient}(x-1,x^2-1)$	0
$\text{polyQuotient}(x^2-1,x-1)$	$x+1$
$\text{polyQuotient}(x^3-6\cdot x^2+11\cdot x-6,x^2-6\cdot x+8)$	
	x

$\text{polyQuotient}((x-y)\cdot(y-z),x+y+z,x)$	$y-z$
$\text{polyQuotient}((x-y)\cdot(y-z),x+y+z,y)$	
	$2\cdot x-y+2\cdot z$

$\text{polyQuotient}((x-y)\cdot(y-z),x+y+z,z)$	$-(x-y)$

polyRemainder()

polyRemainder(*Poly1***,***Poly2*** [,***Var***])** ⇒ *expression*

Returns the remainder of polynomial *Poly1* divided by polynomial *Poly2* with respect to the specified variable *Var*.

Poly1 and *Poly2* must be polynomial expressions in *Var*. We recommend that you do not omit *Var* unless *Poly1* and *Poly2* are expressions in the same single variable.

$\text{polyRemainder}(x-1,x-3)$	2
$\text{polyRemainder}(x-1,x^2-1)$	$x-1$
$\text{polyRemainder}(x^2-1,x-1)$	0

$$\text{polyRemainder}((x-y)\cdot(y-z),x+y+z,x)$$
$$-(y-z)\cdot(2\cdot y+z)$$
$$\text{polyRemainder}((x-y)\cdot(y-z),x+y+z,y)$$
$$-2\cdot x^2-5\cdot x\cdot z-2\cdot z^2$$
$$\text{polyRemainder}((x-y)\cdot(y-z),x+y+z,z)$$
$$(x-y)\cdot(x+2\cdot y)$$

polyRoots()

polyRoots(*Poly***,***Var***)** ⇒ *list*

polyRoots(*ListOfCoeffs***)** ⇒ *list*

The first syntax, **polyRoots(***Poly***,***Var***)**, returns a list of real roots of polynomial *Poly* with respect to variable *Var*. If no real roots exist, returns an empty list: { }.

Poly must be a polynomial in one variable.

The second syntax, **polyRoots (***ListOfCoeffs***)**, returns a list of real roots for the coefficients in *ListOfCoeffs*.

Note: See also **cPolyRoots()**, page 36.

$\text{polyRoots}(y^3+1,y)$	$\{-1\}$

$$\text{cPolyRoots}(y^3+1,y)$$
$$\left\{-1,\frac{1}{2}-\frac{\sqrt{3}}{2}\cdot\boldsymbol{i},\frac{1}{2}+\frac{\sqrt{3}}{2}\cdot\boldsymbol{i}\right\}$$

$\text{polyRoots}(x^2+2\cdot x+1,x)$	$\{-1,-1\}$
$\text{polyRoots}(\{1,2,1\})$	$\{-1,-1\}$

PowerReg

PowerReg *X*,*Y*[**,** *Freq*][**,** *Category*, *Include*]]

Computes the power regression $y = (a \cdot (x)^b)$ on lists *X* and *Y* with frequency *Freq*. A summary of results is stored in the *stat.results* variable. (See page 176.)

All the lists must have equal dimension except for *Include*.

X and *Y* are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding X and Y data point. The default value is 1. All elements must be integers ≥ 0.

Category is a list of category codes for the corresponding X and Y data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.RegEqn	Regression equation: $a \bullet (x)^b$
stat.a, stat.b	Regression coefficients
stat.r^2	Coefficient of linear determination for transformed data
stat.r	Correlation coefficient for transformed data ($\ln(x)$, $\ln(y)$)
stat.Resid	Residuals associated with the power model
stat.ResidTrans	Residuals associated with linear fit of transformed data
stat.XReg	List of data points in the modified X *List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.YReg	List of data points in the modified Y *List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.FreqReg	List of frequencies corresponding to *stat.XReg* and *stat.YReg*

Prgm   Catalog > 📖

Prgm
   Block
EndPrgm

Template for creating a user-defined program. Must be used with the **Define**, **Define LibPub**, or **Define LibPriv** command.

Calculate GCD and display intermediate results.

Block can be a single statement, a series of statements separated with the ":" character, or a series of statements on separate lines.

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

Define *proggcd*(*a,b*)=Prgm
    Local *d*
    While *b*≠0
    d:=mod(*a,b*)
    a:=*b*
    b:=*d*
    Disp *a*," ",*b*
    EndWhile
    Disp "GCD=",*a*
    EndPrgm
                                      Done

proggcd(4560,450)

                            450 60
                            60 30
                            30 0
                          GCD=30
                                   Done

---

prodSeq()   **See Π (), page 223.**

Product (PI)   **See Π (), page 223.**

---

product()   **Catalog >** 📘

product(*List*[**,** *Start*[**,** *End*]]**)** ⇒ *expression*

Returns the product of the elements contained in *List*. *Start* and *End* are optional. They specify a range of elements.

product({1,2,3,4})   24
product({2,*x,y*}) $2 \cdot x \cdot y$
product({4,5,8,9},2,3)   40

product(*Matrix1*[**,** *Start*[**,** *End*]]**)** ⇒ *matrix*

Returns a row vector containing the products of the elements in the columns of *Matrix1*. *Start* and *end* are optional. They specify a range of rows.

$\text{product}\left(\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}\right)$ $\begin{bmatrix} 28 & 80 & 162 \end{bmatrix}$

$\text{product}\left(\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix},1,2\right)$ $\begin{bmatrix} 4 & 10 & 18 \end{bmatrix}$

Empty (void) elements are ignored. For more information on empty elements, see page 251.

---

propFrac()

propFrac($Expr1$[, Var]**) ⇒** *expression*

propFrac($rational\_number$**)** returns *rational_number* as the sum of an integer and a fraction having the same sign and a greater denominator magnitude than numerator magnitude.

$$\text{propFrac}\left(\frac{4}{3}\right) \qquad 1+\frac{1}{3}$$

$$\text{propFrac}\left(\frac{-4}{3}\right) \qquad -1-\frac{1}{3}$$

propFrac($rational\_expression$,Var**)** returns the sum of proper ratios and a polynomial with respect to *Var*. The degree of *Var* in the denominator exceeds the degree of *Var* in the numerator in each proper ratio. Similar powers of *Var* are collected. The terms and their factors are sorted with *Var* as the main variable.

$$\text{propFrac}\left(\frac{x^2+x+1}{x+1}+\frac{y^2+y+1}{y+1},x\right)$$
$$\frac{1}{x+1}+x+\frac{y^2+y+1}{y+1}$$

$$\text{propFrac}(Ans) \qquad \frac{1}{x+1}+x+\frac{1}{y+1}+y$$

If *Var* is omitted, a proper fraction expansion is done with respect to the most main variable. The coefficients of the polynomial part are then made proper with respect to their most main variable first and so on.

For rational expressions, **propFrac()** is a faster but less extreme alternative to **expand()**.

You can use the **propFrac()** function to represent mixed fractions and demonstrate addition and subtraction of mixed fractions.

$$\text{propFrac}\left(\frac{11}{7}\right) \qquad 1+\frac{4}{7}$$

$$\text{propFrac}\left(3+\frac{1}{11}+5+\frac{3}{4}\right) \qquad 8+\frac{37}{44}$$

$$\text{propFrac}\left(3+\frac{1}{11}-\left(5+\frac{3}{4}\right)\right) \qquad -2-\frac{29}{44}$$

Q

QR

QR *Matrix*, *qMatrix*, *rMatrix*[, *Tol*]

Calculates the Householder QR factorization of a real or complex matrix. The resulting Q and R matrices are stored to the specified *Matrix*. The Q matrix is unitary. The R matrix is upper triangular.

The floating-point number (9.) in m1 causes results to be calculated in floating-point form.

Optionally, any matrix element is treated as zero if its absolute value is less than *Tol*. This tolerance is used only if the matrix has floating-point entries and does not contain any symbolic variables that have not been assigned a value. Otherwise, *Tol* is ignored.

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9. \end{bmatrix} \rightarrow m1 \qquad \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9. \end{bmatrix}$$

QR *m1,qm,rm*   *Done*

$$qm \quad \begin{bmatrix} 0.123091 & 0.904534 & 0.408248 \\ 0.492366 & 0.301511 & -0.816497 \\ 0.86164 & -0.301511 & 0.408248 \end{bmatrix}$$

$$rm \quad \begin{bmatrix} 8.12404 & 9.60114 & 11.0782 \\ 0. & 0.904534 & 1.80907 \\ 0. & 0. & 0. \end{bmatrix}$$

- If you use ctrl enter or set the **Auto or Approximate** mode to Approximate, computations are done using floating-point arithmetic.

- If *Tol* is omitted or not used, the default tolerance is calculated as:
  5E−14 •max(dim(*Matrix*)) •rowNorm (*Matrix*)

The QR factorization is computed numerically using Householder transformations. The symbolic solution is computed using Gram-Schmidt. The columns in *qMatName* are the orthonormal basis vectors that span the space defined by *matrix*.

$$\begin{bmatrix} m & n \\ o & p \end{bmatrix} \rightarrow m1 \qquad \begin{bmatrix} m & n \\ o & p \end{bmatrix}$$

QR *m1,qm,rm*   *Done*

$$qm \quad \begin{bmatrix} \dfrac{m}{\sqrt{m^2+o^2}} & \dfrac{-\text{sign}(m \cdot p - n \cdot o) \cdot o}{\sqrt{m^2+o^2}} \\[2ex] \dfrac{o}{\sqrt{m^2+o^2}} & \dfrac{m \cdot \text{sign}(m \cdot p - n \cdot o)}{\sqrt{m^2+o^2}} \end{bmatrix}$$

$$rm \quad \begin{bmatrix} \sqrt{m^2+o^2} & \dfrac{m \cdot n + o \cdot p}{\sqrt{m^2+o^2}} \\[2ex] 0 & \dfrac{|m \cdot p - n \cdot o|}{\sqrt{m^2+o^2}} \end{bmatrix}$$

QuadReg *X*,*Y*[**,** *Freq*][**,** *Category***,** *Include*]]

Computes the quadratic polynomial regression $y = a \cdot x^2 + b \cdot x + c$ on lists *X* and *Y* with frequency *Freq*. A summary of results is stored in the *stat.results* variable. (See page 176.)

All the lists must have equal dimension except for *Include*.

X and *Y* are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding X and Y data point. The default value is 1. All elements must be integers ≥ 0.

Category is a list of category codes for the corresponding X and Y data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.RegEqn	Regression equation: a•x²+b•x+c
stat.a, stat.b, stat.c	Regression coefficients
stat.R²	Coefficient of determination
stat.Resid	Residuals from the regression
stat.XReg	List of data points in the modified *X List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.YReg	List of data points in the modified *Y List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.FreqReg	List of frequencies corresponding to *stat.XReg* and *stat.YReg*

QuartReg   **Catalog >** 📖

QuartReg *X*,*Y*[**,** *Freq*][**,** *Category***,** *Include*]]

Computes the quartic polynomial regression $y = a•x^4 + b•x^3 + c•x^2 + d•x + e$ on lists X and Y with frequency *Freq*. A summary of results is stored in the *stat.results* variable. (See page 176.)

All the lists must have equal dimension except for *Include*.

X and *Y* are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding *X* and *Y* data point. The default value is 1. All elements must be integers ≥ 0.

Category is a list of category codes for the corresponding *X* and *Y* data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.RegEqn	Regression equation: $a \cdot x^4 + b \cdot x^3 + c \cdot x^2 + d \cdot x + e$
stat.a, stat.b, stat.c, stat.d, stat.e	Regression coefficients
stat.R^2	Coefficient of determination
stat.Resid	Residuals from the regression
stat.XReg	List of data points in the modified *X List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.YReg	List of data points in the modified *Y List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.FreqReg	List of frequencies corresponding to *stat.XReg* and *stat.YReg*

R

R►Pθ()   **Catalog >** 📖

R►Pθ (*xExpr***,** *yExpr***)** $\Rightarrow$ *expression*

R►Pθ (*xList***,** *yList***)** $\Rightarrow$ *list*
R►Pθ (*xMatrix***,** *yMatrix***)** $\Rightarrow$ *matrix*

In Degree angle mode:

$$\overline{R \blacktriangleright P\theta(x,y)} \qquad 90 \cdot \text{sign}(y) - \tan^{-1}\left(\frac{x}{y}\right)$$

Returns the equivalent θ-coordinate of the (*x*,*y*) pair arguments.

Note: The result is returned as a degree, gradian or radian angle, according to the current angle mode setting.

Note: You can insert this function from the computer keyboard by typing **R@>Ptheta (...)** .

In Gradian angle mode:

$$R\blacktriangleright P\theta(x,y) \qquad 100\cdot\text{sign}(y)-\tan^{-1}\left(\frac{x}{y}\right)$$

In Radian angle mode:

$$R\blacktriangleright P\theta(3,2) \qquad \tan^{-1}\left(\frac{2}{3}\right)$$

$$R\blacktriangleright P\theta\left(\begin{bmatrix} 3 & -4 & 2 \end{bmatrix}, \begin{bmatrix} 0 & \frac{\pi}{4} & 1.5 \end{bmatrix}\right)$$
$$\begin{bmatrix} 0 & \tan^{-1}\left(\frac{16}{\pi}\right)+\frac{\pi}{2} & 0.643501 \end{bmatrix}$$

R►Pr (*xExpr***,** *yExpr***)** ⇒ *expression*

R►Pr (*xList***,** *yList***)** ⇒ *list*
R►Pr (*xMatrix***,** *yMatrix***)** ⇒ *matrix*

Returns the equivalent r-coordinate of the (*x*,*y*) pair arguments.

Note: You can insert this function from the computer keyboard by typing **R@>Pr (...)** .

In Radian angle mode:

$$R\blacktriangleright Pr(3,2) \qquad \sqrt{13}$$
$$R\blacktriangleright Pr(x,y) \qquad \sqrt{x^2+y^2}$$

$$R\blacktriangleright Pr\left(\begin{bmatrix} 3 & -4 & 2 \end{bmatrix}, \begin{bmatrix} 0 & \frac{\pi}{4} & 1.5 \end{bmatrix}\right)$$
$$\begin{bmatrix} 3 & \frac{\sqrt{\pi^2+256}}{4} & 2.5 \end{bmatrix}$$

---

*Expr1***►Rad** ⇒ *expression*

Converts the argument to radian angle measure.

Note: You can insert this operator from the computer keyboard by typing **@>Rad**.

In Degree angle mode:

$$(1.5)\blacktriangleright Rad \qquad (0.02618)^r$$

In Gradian angle mode:

$$(1.5)\blacktriangleright Rad \qquad (0.023562)^r$$

---

rand() ⇒ *expression*
rand(*#Trials***)** ⇒ *list*

Set the random-number seed.

rand()   Catalog > 📖

rand() returns a random value between 0 and 1.

rand(#*Trials***)** returns a list containing #*Trials* random values between 0 and 1.

RandSeed 1147	*Done*
rand(2)	{0.158206,0.717917}

randBin()   Catalog > 📖

randBin(*n, p***)** ⇒ *expression*
randBin(*n, p, #Trials***)** ⇒ *list*

randBin(*n, p***)** returns a random real number from a specified Binomial distribution.

randBin(*n, p, #Trials***)** returns a list containing #*Trials* random real numbers from a specified Binomial distribution.

randBin(80,0.5)	42
randBin(80,0.5,3)	{41,32,39}

randInt()   Catalog > 📖

**randInt
(***lowBound,upBound***)**
⇒ *expression*
**randInt
(***lowBound,upBound
,#Trials***)** ⇒ *list*

**randInt
(***lowBound,upBound***)**
returns a random
integer within the
range specified by
lowBound and
upBound integer
bounds.

**randInt
(***lowBound,upBound
,#Trials***)** returns a
list containing
#*Trials* random
integers within the
specified range.

randInt(3,10)	5
randInt(3,10,4)	{9,7,5,8}

randMat()

randMat(_numRows_**,** _numColumns_**)** ⇒ _matrix_

Returns a matrix of integers between -9 and 9 of the specified dimension.

Both arguments must simplify to integers.

RandSeed 1147			_Done_
randMat(3,3)	8	-3	6
	-2	3	-6
	0	4	-6

Note: The values in this matrix will change each time you press ⟨enter⟩.

randNorm()

randNorm(μ, σ**)** ⇒ _expression_
randNorm(μ, σ**,** _#Trials_**)** ⇒ _list_

randNorm(μ, σ**)** returns a decimal number from the specified normal distribution. It could be any real number but will be heavily concentrated in the interval [μ−3•σ, μ+3•σ].

randNorm(μ, σ**,** _#Trials_**)** returns a list containing _#Trials_ decimal numbers from the specified normal distribution.

RandSeed 1147	_Done_
randNorm(0,1)	0.492541
randNorm(3,4.5)	-3.54356

randPoly()

randPoly(_Var_**,** _Order_**)** ⇒ _expression_

Returns a polynomial in _Var_ of the specified _Order_. The coefficients are random integers in the range −9 through 9. The leading coefficient will not be zero.

Order must be 0–99.

RandSeed 1147	_Done_
randPoly(x,5)	$-2 \cdot x^5 + 3 \cdot x^4 - 6 \cdot x^3 + 4 \cdot x - 6$

randSamp()

randSamp(_List_**,**_#Trials_[**,**_noRepl_]**)** ⇒ _list_

Returns a list containing a random sample of _#Trials_ trials from _List_ with an option for sample replacement (_noRepl_=0), or no sample replacement (_noRepl_=1). The default is with sample replacement.

Define _list3_={1,2,3,4,5}	_Done_
Define _list4_=randSamp(_list3_,6)	_Done_
list4	{2,3,4,3,1,2}

RandSeed

RandSeed *Number*

If *Number* = 0, sets the seeds to the factory defaults for the random-number generator. If *Number* ≠ 0, it is used to generate two seeds, which are stored in system variables seed1 and seed2.

RandSeed 1147	*Done*
rand()	0.158206

real()

real(*Expr1***)** ⇒ *expression*

Returns the real part of the argument.

Note: All undefined variables are treated as real variables. See also **imag()**, page 88.

real(*List1***)** ⇒ *list*

Returns the real parts of all elements.

real(*Matrix1***)** ⇒ *matrix*

Returns the real parts of all elements.

$\text{real}(2+3\cdot i)$	2
$\text{real}(z)$	z
$\text{real}(x+i\cdot y)$	x

$$\text{real}(\{a+i\cdot b,3,i\}) \qquad \{a,3,0\}$$

$$\text{real}\left(\begin{bmatrix} a+i\cdot b & 3 \\ c & i \end{bmatrix}\right) \qquad \begin{bmatrix} a & 3 \\ c & 0 \end{bmatrix}$$

►Rect

Vector ►**Rect**

Note: You can insert this operator from the computer keyboard by typing @>**Rect**.

Displays *Vector* in rectangular form [x, y, z]. The vector must be of dimension 2 or 3 and can be a row or a column.

Note: ►**Rect** is a display-format instruction, not a conversion function. You can use it only at the end of an entry line, and it does not update *ans*.

Note: See also ►**Polar**, page 133.

$$\left[\begin{bmatrix} 3 & \angle\dfrac{\pi}{4} & \angle\dfrac{\pi}{6} \end{bmatrix}\right]\blacktriangleright\text{Rect}$$

$$\begin{bmatrix} \dfrac{3\cdot\sqrt{2}}{4} & \dfrac{3\cdot\sqrt{2}}{4} & \dfrac{3\cdot\sqrt{3}}{2} \end{bmatrix}$$

$$\begin{bmatrix} a & \angle b & \angle c \end{bmatrix}$$
$$\begin{bmatrix} a\cdot\cos(b)\cdot\sin(c) & a\cdot\sin(b)\cdot\sin(c) & a\cdot\cos(c) \end{bmatrix}$$

complexValue ►**Rect**

Displays *complexValue* in rectangular form a+bi. The *complexValue* can have any complex form. However, an re^{iθ} entry causes an error in Degree angle mode.

Note: You must use parentheses for an (r∠ θ) polar entry.

In Radian angle mode:

$$\left(4\cdot e^{\dfrac{\pi}{3}}\right)\blacktriangleright\text{Rect} \qquad 4\cdot e^{\dfrac{\pi}{3}}$$

$$\left(\left(4\angle\dfrac{\pi}{3}\right)\right)\blacktriangleright\text{Rect} \qquad 2+2\cdot\sqrt{3}\cdot i$$

In Gradian angle mode:

$$(\langle 1 \angle 100 \rangle) \blacktriangleright \text{Rect} \qquad\qquad i$$

In Degree angle mode:

$$(\langle 4 \angle 60 \rangle) \blacktriangleright \text{Rect} \qquad\qquad 2 + 2 \cdot \sqrt{3} \cdot i$$

Note: To type $\angle$, select it from the symbol list in the Catalog.

---

ref()   **Catalog >** 📖

ref(_Matrix1_[**,** _Tol_]**)** ⇒ _matrix_

Returns the row echelon form of _Matrix1_.

$$\text{ref}\!\begin{pmatrix}\begin{bmatrix} -2 & -2 & 0 & -6 \\ 1 & -1 & 9 & -9 \\ -5 & 2 & 4 & -4 \end{bmatrix}\end{pmatrix} \quad \begin{bmatrix} 1 & \dfrac{-2}{5} & \dfrac{-4}{5} & \dfrac{4}{5} \\ 0 & 1 & \dfrac{4}{7} & \dfrac{11}{7} \\ 0 & 0 & 1 & \dfrac{-62}{71} \end{bmatrix}$$

Optionally, any matrix element is treated as zero if its absolute value is less than _Tol_. This tolerance is used only if the matrix has floating-point entries and does not contain any symbolic variables that have not been assigned a value. Otherwise, _Tol_ is ignored.

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} \rightarrow m1 \qquad\qquad \begin{bmatrix} a & b \\ c & d \end{bmatrix}$$

$$\text{ref}(m1) \qquad\qquad \begin{bmatrix} 1 & \dfrac{d}{c} \\ 0 & 1 \end{bmatrix}$$

⚠

- If you use [ctrl] [enter] or set the **Auto or Approximate** mode to Approximate, computations are done using floating-point arithmetic.
- If _Tol_ is omitted or not used, the default tolerance is calculated as:
  5E−14 •max(dim(_Matrix1_)) •rowNorm (_Matrix1_)

Avoid undefined elements in _Matrix1_. They can lead to unexpected results.

For example, if _a_ is undefined in the following expression, a warning message appears and the result is shown as:

$$\text{ref}\!\begin{pmatrix}\begin{bmatrix} a & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\end{pmatrix} \qquad \begin{bmatrix} 1 & \dfrac{1}{a} & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

The warning appears because the generalized element $1/a$ would not be valid for a=0.

You can avoid this by storing a value to a beforehand or by using the constraint ("|") operator to substitute a value, as shown in the following example.

$$\text{ref}\left(\begin{bmatrix} a & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) | a=0 \qquad \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix}$$

Note: See also **rref()**, page 156.

RefreshProbeVars

Allows you to access sensor data from all connected sensor probes in your TI-Basic program.

StatusVar Value	Status
$statusVar$ =0	Normal (continue with the program)
$statusVar$ =1	The Vernier DataQuest™ application is in data collection mode. **Note:** The Vernier DataQuest™ application must be in meter mode for this command to work. ⊕
$statusVar$ =2	The Vernier DataQuest™ application is not launched.
$statusVar$ =3	The Vernier DataQuest™ application is launched, but you have not connected any probes.

Example

```
Define temp()=

Prgm

© Check if system is ready

RefreshProbeVars status

If status=0 Then

Disp "ready"

For n,1,50

RefreshProbeVars status

temperature:=meter.temperature

Disp "Temperature:
",temperature

If temperature>30 Then

Disp "Too hot"

EndIf

© Wait for 1 second between
samples

Wait 1

EndFor
```

```
Else
Disp "Not ready. Try again
later"
EndIf
EndPrgm
```

Note: This can also be used with TI-Innovator™ Hub.

remain()	**Catalog > ▧**

remain(*Expr1***,** *Expr2***)** ⇒ *expression*

remain(*List1***,** *List2***)** ⇒ *list*
remain(*Matrix1***,** *Matrix2***)** ⇒ *matrix*

Returns the remainder of the first argument with respect to the second argument as defined by the identities:

remain(x,0)   x
remain(x,y)   x−y•iPart(x/y)

As a consequence, note that **remain(**−x,y**)** − **remain(**x,y**)**. The result is either zero or it has the same sign as the first argument.

Note: See also **mod()**, page 116.

$$\begin{array}{ll} \text{remain}(7,0) & 7 \\ \text{remain}(7,3) & 1 \\ \text{remain}(\text{-}7,3) & \text{-}1 \\ \text{remain}(7,\text{-}3) & 1 \\ \text{remain}(\text{-}7,\text{-}3) & \text{-}1 \\ \text{remain}(\{12,\text{-}14,16\},\{9,7,\text{-}5\}) & \{3,0,1\} \end{array}$$

$$\text{remain}\left(\begin{bmatrix} 9 & \text{-}7 \\ 6 & 4 \end{bmatrix}, \begin{bmatrix} 4 & 3 \\ 4 & \text{-}3 \end{bmatrix}\right) \qquad \begin{bmatrix} 1 & \text{-}1 \\ 2 & 1 \end{bmatrix}$$

Request	**Catalog > ▧**

Request *promptString***,** *var*[**,** *DispFlag* [**,** *statusVar*]]

Request *promptString***,** *func***(***arg1***,** *...argn***)** [**,** *DispFlag* [**,** *statusVar*]]

Programming command: Pauses the program and displays a dialog box containing the message *promptString* and an input box for the user's response.

When the user types a response and clicks **OK**, the contents of the input box are assigned to variable *var*.

Define a program:

```
Define request_demo()=Prgm
    Request "Radius: ",r
    Disp "Area = ",pi*r²
EndPrgm
```

Run the program and type a response:

```
request_demo()
```

If the user clicks **Cancel**, the program proceeds without accepting any input. The program uses the previous value of *var* if *var* was already defined.

The optional *DispFlag* argument can be any expression.

- If *DispFlag* is omitted or evaluates to **1**, the prompt message and user's response are displayed in the Calculator history.
- If *DispFlag* evaluates to **0**, the prompt and response are not displayed in the history.

The optional *statusVar* argument gives the program a way to determine how the user dismissed the dialog box. Note that *statusVar* requires the *DispFlag* argument.

- If the user clicked **OK** or pressed **Enter** or **Ctrl+Enter**, variable *statusVar* is set to a value of **1**.
- Otherwise, variable *statusVar* is set to a value of **0**.

The *func*() argument allows a program to store the user's response as a function definition. This syntax operates as if the user executed the command:

Define *func*(*arg1, ...argn*) = *user's response*

The program can then use the defined function *func*(). The *promptString* should guide the user to enter an appropriate *user's response* that completes the function definition.

Note: You can use the Request command within a user-defined program but not within a function.

To stop a program that contains a **Request** command inside an infinite loop:

- **Handheld:** Hold down the ⌂ on key and press enter repeatedly.

Result after selecting **OK**:

```
Radius: 6/2
Area= 28.2743
```

Define a program:

```
Define polynomial()=Prgm
    Request "Enter a polynomial in
x:",p(x)
    Disp "Real roots are:",polyRoots
(p(x),x)
EndPrgm
```

Run the program and type a response:

```
polynomial()
```

Result after entering x^3+3x+1 and selecting **OK**:

```
Real roots are: {-0.322185}
```

- **Windows®:** Hold down the **F12** key and press **Enter** repeatedly.
- **Macintosh®:** Hold down the **F5** key and press **Enter** repeatedly.
- **iPad®:** The app displays a prompt. You can continue waiting or cancel.

Note: See also **RequestStr**, page 151.

RequestStr Catalog > 📖

RequestStr *promptString*, *var*[, *DispFlag*]

Programming command: Operates identically to the first syntax of the **Request** command, except that the user's response is always interpreted as a string. By contrast, the **Request** command interprets the response as an expression unless the user encloses it in quotation marks ("").

Note: You can use the **RequestStr** command within a user-defined program but not within a function.

To stop a program that contains a **RequestStr** command inside an infinite loop:

- **Handheld:** Hold down the `⌂ on` key and press `enter` repeatedly.
- **Windows®:** Hold down the **F12** key and press **Enter** repeatedly.
- **Macintosh®:** Hold down the **F5** key and press **Enter** repeatedly.
- **iPad®:** The app displays a prompt. You can continue waiting or cancel.

Note: See also **Request**, page 149.

Define a program:

```
Define requestStr_demo()=Prgm
    RequestStr "Your name:",name,0
    Disp "Response has ",dim(name),"
characters."
EndPrgm
```

Run the program and type a response:

```
requestStr_demo()
```

| Your name: | Frank |
| OK | Cancel |

Result after selecting **OK** (Note that the *DispFlag* argument of **0** omits the prompt and response from the history):

```
requestStr_demo()
```

```
            Response has 5 characters.
```

Return

Return [*Expr*]

Returns *Expr* as the result of the function. Use within a **Func**...**EndFunc** block.

Note: Use **Return** without an argument within a **Prgm**...**EndPrgm** block to exit a program.

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

Define **factorial** (*nn*)=
Func
Local *answer*,*counter*
$1 \rightarrow answer$
For *counter*,1,*nn*
$answer \cdot counter \rightarrow answer$
EndFor
Return *answer*
EndFunc

$factorial (3)$ 6

---

right()

right(*List1*[**,** *Num*]**)** ⇒ *list*

Returns the rightmost *Num* elements contained in *List1*.

If you omit *Num*, returns all of *List1*.

$right(\{1,3,\text{-}2,4\},3)$ $\{3,\text{-}2,4\}$

right(*sourceString*[**,** *Num*]**)** ⇒ *string*

Returns the rightmost *Num* characters contained in character string *sourceString*.

If you omit *Num*, returns all of *sourceString*.

$right("Hello",2)$ "lo"

right(*Comparison***)** ⇒ *expression*

Returns the right side of an equation or inequality.

$right(x<3)$ 3

---

rk23 ()

rk23(*Expr*, *Var*, *depVar*, **{***Var0*, *VarMax***}**, *depVar0*, *VarStep* [**,** *diftol*]**)** ⇒ *matrix*

rk23(*SystemOfExpr*, *Var*, *ListOfDepVars*, **{***Var0*, *VarMax***}**, *ListOfDepVars0*, *VarStep*[**,** *diftol*]**)** ⇒ *matrix*

rk23(*ListOfExpr*, *Var*, *ListOfDepVars*, **{***Var0*, *VarMax***}**, *ListOfDepVars0*, *VarStep*[**,** *diftol*]**)** ⇒ *matrix*

Differential equation:

y'=0.001*y*(100-y) and y(0)=10

$rk23(0.001 \cdot y \cdot (100\text{-}y),t,y,\{0,100\},10,1)$

$\begin{bmatrix} 0. & 1. & 2. & 3. & 4. \\ 10. & 10.9367 & 11.9493 & 13.042 & 14.2 \end{bmatrix}$

To see the entire result,
press ▲ and then use ◄ and ► to move the cursor.

Uses the Runge-Kutta method to solve the system

$$\frac{d\ depVar}{d\ Var} = Expr(Var, depVar)$$

with $depVar(Var0)=depVar0$ on the interval $[Var0, VarMax]$. Returns a matrix whose first row defines the Var output values as defined by $VarStep$. The second row defines the value of the first solution component at the corresponding Var values, and so on.

$Expr$ is the right hand side that defines the ordinary differential equation (ODE).

$SystemOfExpr$ is a system of right-hand sides that define the system of ODEs (corresponds to order of dependent variables in $ListOfDepVars$).

$ListOfExpr$ is a list of right-hand sides that define the system of ODEs (corresponds to order of dependent variables in $ListOfDepVars$).

Var is the independent variable.

$ListOfDepVars$ is a list of dependent variables.

$\{Var0, VarMax\}$ is a two-element list that tells the function to integrate from $Var0$ to $VarMax$.

$ListOfDepVars0$ is a list of initial values for dependent variables.

If $VarStep$ evaluates to a nonzero number: sign($VarStep$) = sign($VarMax$-$Var0$) and solutions are returned at $Var0+i*VarStep$ for all i=0,1,2,… such that $Var0+i*VarStep$ is in $[var0, VarMax]$ (may not get a solution value at $VarMax$).

if $VarStep$ evaluates to zero, solutions are returned at the "Runge-Kutta" Var values.

$diftol$ is the error tolerance (defaults to 0.001).

Same equation with $diftol$ set to 1.ᴇ−6

$$rk23\big(0.001 \cdot y \cdot (100-y), t, y, \{0,100\}, 10, 1, 1.\text{E-}6\big)$$

0.	1.	2.	3.	4.	▸
10.	10.9367	11.9495	13.0423	14.2189	

Compare above result with CAS exact solution obtained using deSolve() and seqGen():

$$deSolve\big(y'=0.001 \cdot y \cdot (100-y) \text{ and } y(0)=10, t, y\big)$$

$$y = \frac{100 \cdot (1.10517)^t}{(1.10517)^t + 9.}$$

$$seqGen\left(\frac{100 \cdot (1.10517)^t}{(1.10517)^t + 9.}, t, y, \{0,100\}\right)$$

$$\{10., 10.9367, 11.9494, 13.0423, 14.2189, 15.4\text{▸}$$

System of equations:

$$\begin{cases} y1' = -y1 + 0.1 \cdot y1 \cdot y2 \\ y2 = 3 \cdot y2 - y1 \cdot y2 \end{cases}$$

with $y1(0)=2$ and $y2(0)=5$

$$rk23\left(\begin{bmatrix} -y1 + 0.1 \cdot y1 \cdot y2 \\ 3 \cdot y2 - y1 \cdot y2 \end{bmatrix}, t, \{y1, y2\}, \{0,5\}, \{2,5\}, 1\right)$$

0.	1.	2.	3.	4.	▸
2.	1.94103	4.78694	3.25253	1.82848	
5.	16.8311	12.3133	3.51112	6.27245	

root()	**Catalog > **

root(*Expr*) ⇒ *root*
root(*Expr1*, *Expr2*) ⇒ *root*

root(*Expr*) returns the square root of *Expr*.

root(*Expr1*, *Expr2*) returns the *Expr2* root of *Expr1*. *Expr1* can be a real or complex floating point constant, an integer or complex rational constant, or a general symbolic expression.

Note: See also **Nth root template**, page 1.

$$\sqrt[3]{8} \qquad 2$$

$$\sqrt[3]{3} \qquad \frac{1}{3^{\frac{1}{3}}}$$

$$\sqrt[3]{3.} \qquad 1.44225$$

rotate()	**Catalog > **

rotate(*Integer1*[,*#ofRotations*]) ⇒ *integer*

Rotates the bits in a binary integer. You can enter *Integer1* in any number base; it is converted automatically to a signed, 64-bit binary form. If the magnitude of *Integer1* is too large for this form, a symmetric modulo operation brings it within the range. For more information, see ▶**Base2**, page 17.

In Bin base mode:

rotate(0b11111111111111111111111111111111)
0b1000000000000000000000000000000001▶
rotate(256,1)   0b1000000000

To see the entire result,
press ▲ and then use ◄ and ▶ to move the cursor.

If *#ofRotations* is positive, the rotation is to the left. If *#ofRotations* is negative, the rotation is to the right. The default is −1 (rotate right one bit).

For example, in a right rotation:

Each bit rotates right.

0b00000000000000111101011000011 0101

Rightmost bit rotates to leftmost.

produces:

0b10000000000000011110101100001 1010

The result is displayed according to the Base mode.

In Hex base mode:

rotate(0h78E)	0h3C7
rotate(0h78E,‑2)	0h80000000000001E3
rotate(0h78E,2)	0h1E38

Important: To enter a binary or hexadecimal number, always use the 0b or 0h prefix (zero, not the letter O).

rotate(*List1*[,*#ofRotations*]) ⇒ *list*

Returns a copy of *List1* rotated right or left by *#of Rotations* elements. Does not alter *List1*.

In Dec base mode:

rotate({1,2,3,4})	{4,1,2,3}
rotate({1,2,3,4},‑2)	{3,4,1,2}
rotate({1,2,3,4},1)	{2,3,4,1}

rotate()

If *#ofRotations* is positive, the rotation is to the left. If *#of Rotations* is negative, the rotation is to the right. The default is −1 (rotate right one element).

rotate(*String1*[**,***#ofRotations*]**)** ⇒ *string*

rotate("abcd")	"dabc"
rotate("abcd",-2)	"cdab"
rotate("abcd",1)	"bcda"

Returns a copy of *String1* rotated right or left by *#ofRotations* characters. Does not alter *String1*.

If *#ofRotations* is positive, the rotation is to the left. If *#ofRotations* is negative, the rotation is to the right. The default is −1 (rotate right one character).

round(*Expr1*[**,** *digits*]**)** ⇒ *expression*

round(1.234567,3)   1.235

Returns the argument rounded to the specified number of digits after the decimal point.

digits must be an integer in the range 0–12. If *digits* is not included, returns the argument rounded to 12 significant digits.

Note: Display digits mode may affect how this is displayed.

round(*List1*[**,** *digits*]**)** ⇒ *list*

$$\text{round}\left(\left\{\pi,\sqrt{2},\ln(2)\right\},4\right)$$
$$\left\{3.1416,1.4142,0.6931\right\}$$

Returns a list of the elements rounded to the specified number of digits.

round(*Matrix1*[**,** *digits*]**)** ⇒ *matrix*

$$\text{round}\left(\begin{bmatrix} \ln(5) & \ln(3) \\ \pi & e^1 \end{bmatrix},1\right) \quad \begin{bmatrix} 1.6 & 1.1 \\ 3.1 & 2.7 \end{bmatrix}$$

Returns a matrix of the elements rounded to the specified number of digits.

rowAdd(*Matrix1***,** *rIndex1***,** *rIndex2***)** ⇒ *matrix*

$$\text{rowAdd}\left(\begin{bmatrix} 3 & 4 \\ -3 & -2 \end{bmatrix},1,2\right) \quad \begin{bmatrix} 3 & 4 \\ 0 & 2 \end{bmatrix}$$

$$\text{rowAdd}\left(\begin{bmatrix} a & b \\ c & d \end{bmatrix},1,2\right) \quad \begin{bmatrix} a & b \\ a+c & b+d \end{bmatrix}$$

Returns a copy of *Matrix1* with row *rIndex2* replaced by the sum of rows *rIndex1* and *rIndex2*.

rowDim()   **Catalog >**

rowDim(*Matrix***)** $\Rightarrow$ *expression*

Returns the number of rows in *Matrix*.

Note: See also **colDim()**, page 26.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix} \rightarrow m1 \qquad \begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix}$$

$$\text{rowDim}(m1) \qquad\qquad\qquad 3$$

---

rowNorm()   **Catalog >**

rowNorm(*Matrix***)** $\Rightarrow$ *expression*

Returns the maximum of the sums of the absolute values of the elements in the rows in *Matrix*.

Note: All matrix elements must simplify to numbers. See also **colNorm()**, page 26.

$$\text{rowNorm}\begin{bmatrix} -5 & 6 & -7 \\ 3 & 4 & 9 \\ 9 & -9 & -7 \end{bmatrix} \qquad 25$$

---

rowSwap()   **Catalog >**

rowSwap(*Matrix1***,** *rIndex1***,** *rIndex2***)** $\Rightarrow$ *matrix*

Returns *Matrix1* with rows *rIndex1* and *rIndex2* exchanged.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix} \rightarrow mat \qquad \begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix}$$

$$\text{rowSwap}(mat,1,3) \qquad \begin{bmatrix} 5 & 6 \\ 3 & 4 \\ 1 & 2 \end{bmatrix}$$

---

rref()   **Catalog >**

rref(*Matrix1*[**,** *Tol*]**)** $\Rightarrow$ *matrix*

Returns the reduced row echelon form of *Matrix1*.

$$\text{rref}\begin{bmatrix} -2 & -2 & 0 & -6 \\ 1 & -1 & 9 & -9 \\ -5 & 2 & 4 & -4 \end{bmatrix} \qquad \begin{bmatrix} 1 & 0 & 0 & \frac{66}{71} \\ 0 & 1 & 0 & \frac{147}{71} \\ 0 & 0 & 1 & \frac{-62}{71} \end{bmatrix}$$

Optionally, any matrix element is treated as zero if its absolute value is less than *Tol*. This tolerance is used only if the matrix has floating-point entries and does not contain any symbolic variables that have not been assigned a value. Otherwise, *Tol* is ignored.

⚠ $\text{rref}\begin{bmatrix} a & b \\ c & d \end{bmatrix} \qquad \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

• If you use `ctrl` `enter` or set the **Auto or Approximate** mode to Approximate, computations are done using floating-point arithmetic.

- If *Tol* is omitted or not used, the default tolerance is calculated as:
5E−14 •max(dim(*Matrix1*)) •rowNorm (*Matrix1*)

Note: See also **ref()**, page 147.

S

---

sec() [trig] **key**

sec(*Expr1***)** ⇒ *expression*

sec(*List1***)** ⇒ *list*

Returns the secant of *Expr1* or returns a list containing the secants of all elements in *List1*.

Note: The argument is interpreted as a degree, gradian or radian angle, according to the current angle mode setting. You can use °, ᴳ, or ʳ to override the angle mode temporarily.

In Degree angle mode:

$$\sec(45) \qquad \qquad \sqrt{2}$$

$$\sec(\{1,2.3,4\}) \qquad \left\{\frac{1}{\cos(1)}, 1.00081, \frac{1}{\cos(4)}\right\}$$

---

sec⁻¹() [trig] **key**

sec⁻¹(*Expr1***)** ⇒ *expression*

sec⁻¹(*List1***)** ⇒ *list*

Returns the angle whose secant is *Expr1* or returns a list containing the inverse secants of each element of *List1*.

Note: The result is returned as a degree, gradian, or radian angle, according to the current angle mode setting.

Note: You can insert this function from the keyboard by typing **arcsec(...)**.

In Degree angle mode:

$$\sec^{-1}(1) \qquad \qquad 0$$

In Gradian angle mode:

$$\sec^{-1}(\sqrt{2}) \qquad \qquad 50$$

In Radian angle mode:

$$\sec^{-1}(\{1,2,5\}) \qquad \left\{0, \frac{\pi}{3}, \cos^{-1}\left(\frac{1}{5}\right)\right\}$$

sech()

sech(*Expr1***)** $\Rightarrow$ *expression*

sech(*List1***)** $\Rightarrow$ *list*

Returns the hyperbolic secant of *Expr1* or returns a list containing the hyperbolic secants of the *List1* elements.

$$\text{sech}(3) \qquad \frac{1}{\cosh(3)}$$
$$\text{sech}(\{1,2.3,4\})$$
$$\left\{ \frac{1}{\cosh(1)}, 0.198522, \frac{1}{\cosh(4)} \right\}$$

---

sech⁻¹()

sech⁻¹(*Expr1***)** $\Rightarrow$ *expression*

sech⁻¹(*List1***)** $\Rightarrow$ *list*

Returns the inverse hyperbolic secant of *Expr1* or returns a list containing the inverse hyperbolic secants of each element of *List1*.

Note: You can insert this function from the keyboard by typing **arcsech(...)**.

In Radian angle and Rectangular complex mode:

$$\text{sech}^{-1}(1) \qquad 0$$
$$\text{sech}^{-1}(\{1,-2,2.1\})$$
$$\left\{ 0, \frac{2 \cdot \pi}{3} \cdot i, 8.\text{E}^{-}15 + 1.07448 \cdot i \right\}$$

Send

Send *exprOrString1* [**,** *exprOrString2*] ...

Programming command: Sends one or more TI-Innovator™ Hub commands to a connected hub.

exprOrString must be a valid TI-Innovator™ Hub Command. Typically, *exprOrString* contains a **"SET ..."** command to control a device or a **"READ ..."** command to request data.

The arguments are sent to the hub in succession.

Note: You can use the **Send** command within a user-defined program but not within a function.

Note: See also **Get** (page 77), **GetStr** (page 84), and **eval()** (page 61).

Example: Turn on the blue element of the built-in RGB LED for 0.5 seconds.

Send "SET COLOR.BLUE ON TIME .5"	
	Done

Example: Request the current value of the hub's built-in light-level sensor. A **Get** command retrieves the value and assigns it to variable *lightval*.

Send "READ BRIGHTNESS"	Done
Get *lightval*	Done
lightval	0.347922

Example: Send a calculated frequency to the hub's built-in speaker. Use special variable *iostr.SendAns* to show the hub command with the expression evaluated.

$n:=50$	50
$m:=4$	4
Send "SET SOUND eval(m· n)"	*Done*
iostr.SendAns	"SET SOUND 200"

---

seq()   **Catalog >** 📖

seq(*Expr***,** *Var***,** *Low***,** *High*[**,** *Step*]**)** ⇒ *list*

Increments *Var* from *Low* through *High* by an increment of *Step*, evaluates *Expr*, and returns the results as a list. The original contents of *Var* are still there after **seq()** is completed.

The default value for *Step* = 1.

$\text{seq}(n^2, n, 1, 6)$	$\{1, 4, 9, 16, 25, 36\}$
$\text{seq}\left(\dfrac{1}{n}, n, 1, 10, 2\right)$	$\left\{1, \dfrac{1}{3}, \dfrac{1}{5}, \dfrac{1}{7}, \dfrac{1}{9}\right\}$
$\text{sum}\left(\text{seq}\left(\dfrac{1}{n^2}, n, 1, 10, 1\right)\right)$	$\dfrac{1968329}{1270080}$

Note: To force an approximate result,

Handheld: Press ⌃ enter .
Windows®: Press **Ctrl+Enter**.
Macintosh®: Press ⌘+**Enter**.
iPad®: Hold **enter**, and select ≈ .

$\text{sum}\left(\text{seq}\left(\dfrac{1}{n^2}, n, 1, 10, 1\right)\right)$	1.54977

---

seqGen()   **Catalog >** 📖

seqGen(*Expr***,** *Var***,** *depVar***,** {*Var0***,** *VarMax*}[**,** *ListOfInitTerms* [**,** *VarStep*[**,** *CeilingValue*]]]**)** ⇒ *list*

Generates a list of terms for sequence *depVar*(*Var*)=*Expr* as follows: Increments independent variable *Var* from *Var0* through *VarMax* by *VarStep*, evaluates *depVar*(*Var*) for corresponding values of *Var* using the *Expr* formula and *ListOfInitTerms*, and returns the results as a list.

seqGen(*ListOrSystemOfExpr***,** *Var***,** *ListOfDepVars***,** {*Var0***,** *VarMax*} [**,** *MatrixOfInitTerms*[**,** *VarStep*[**,** *CeilingValue*]]]**)** ⇒ *matrix*

Generate the first 5 terms of the sequence *u* (*n*) = *u*(n-1)²/2, with *u*(1)=**2** and *VarStep*=**1**.

$$\text{seqGen}\left(\dfrac{(u(n-1))^2}{n}, n, u, \{1, 5\}, \{2\}\right)$$
$$\left\{2, 2, \dfrac{4}{3}, \dfrac{4}{9}, \dfrac{16}{405}\right\}$$

Example in which Var0=2:

$$\text{seqGen}\left(\dfrac{u(n-1)+1}{n}, n, u, \{2, 5\}, \{3\}\right)$$
$$\left\{3, \dfrac{4}{3}, \dfrac{7}{12}, \dfrac{19}{60}\right\}$$

Generates a matrix of terms for a system (or list) of sequences *ListOfDepVars*(*Var*) =*ListOrSystemOfExpr* as follows: Increments independent variable *Var* from *Var0* through *VarMax* by *VarStep*, evaluates *ListOfDepVars*(*Var*) for corresponding values of *Var* using *ListOrSystemOfExpr* formula and *MatrixOfInitTerms*, and returns the results as a matrix.

The original contents of *Var* are unchanged after **seqGen()** is completed.

The default value for *VarStep* = **1**.

Example in which initial term is symbolic:

$$\text{seqGen}\big(u(n-1)+2,n,u,\{1,5\},\{a\}\big)$$
$$\{a,a+2,a+4,a+6,a+8\}$$

System of two sequences:

$$\text{seqGen}\left(\left\{\frac{1}{n},\frac{u2(n-1)}{2}+u1(n-1)\right\},n,\{u1,u2\},\{1,5\},\begin{bmatrix}\_\\2\end{bmatrix}\right)$$

$$\begin{bmatrix}1 & \frac{1}{2} & \frac{1}{3} & \frac{1}{4} & \frac{1}{5}\\ 2 & 2 & \frac{3}{2} & \frac{13}{12} & \frac{19}{24}\end{bmatrix}$$

Note: The Void (_) in the initial term matrix above is used to indicate that the initial term for u1(n) is calculated using the explicit sequence formula u1(n)=1/n.

seqn(Expr(*u, n*[, *ListOfInitTerms*[, *nMax*[, *CeilingValue*]]]**)** ⇒ *list*

Generates a list of terms for a sequence *u* (*n*)=*Expr*(*u, n*) as follows: Increments *n* from 1 through *nMax* by 1, evaluates *u*(*n*) for corresponding values of *n* using the *Expr*(*u, n*) formula and *ListOfInitTerms*, and returns the results as a list.

seqn(Expr(*n*[, *nMax*[, *CeilingValue*]]**)** ⇒ *list*

Generates a list of terms for a non-recursive sequence *u*(*n*)=*Expr*(*n*) as follows: Increments *n* from 1 through *nMax* by 1, evaluates *u*(*n*) for corresponding values of *n* using the *Expr*(*n*) formula, and returns the results as a list.

If *nMax* is missing, *nMax* is set to 2500

If *nMax*=0, *nMax* is set to 2500

Note: seqn() calls **seqGen( )** with *n0*=**1** and *nstep* =**1**

Generate the first 6 terms of the sequence *u* (*n*) = *u*(*n*-1)/2, with *u*(1)=**2**.

$$\text{seqn}\left(\frac{u(n-1)}{n},\{2\},6\right)$$
$$\left\{2,1,\frac{1}{3},\frac{1}{12},\frac{1}{60},\frac{1}{360}\right\}$$

$$\text{seqn}\left(\frac{1}{n^2},6\right)$$
$$\left\{1,\frac{1}{4},\frac{1}{9},\frac{1}{16},\frac{1}{25},\frac{1}{36}\right\}$$

series(*Expr1***,** *Var***,** *Order*[**,** *Point*]**)** ⇒ *expression*

series(*Expr1***,** *Var***,** *Order*[**,** *Point*]**) |** *Var***>***Point* ⇒ *expression*

series(*Expr1***,** *Var***,** *Order*[**,** *Point*]**) |** *Var***<***Point* ⇒ *expression*

$\text{series}\left(\dfrac{1-\cos(x-1)}{(x-1)^2},x,4,1\right)$	$\dfrac{1}{2}-\dfrac{(x-1)^2}{24}+\dfrac{(x-1)^4}{720}$
$\text{series}\left(\dfrac{-1}{e^{z_-}},z_-,1\right)$	z_--1
$\text{series}\left(\left(1+\dfrac{1}{n}\right)^n,n,2,\infty\right)$	$e-\dfrac{e}{2\cdot n}+\dfrac{11\cdot e}{24\cdot n^2}$

$\text{series}\left(\tan^{-1}\left(\dfrac{1}{x}\right),x,5\right)\big|x>0$	$\dfrac{\pi}{2}-x+\dfrac{x^3}{3}-\dfrac{x^5}{5}$
$\text{series}\left(\displaystyle\int\dfrac{\sin(x)}{x}\,dx,x,6\right)$	$x-\dfrac{x^3}{18}+\dfrac{x^5}{600}$
$\text{series}\left(\displaystyle\int_0^x\sin(x\cdot\sin(t))\,dt,x,7\right)$	$\dfrac{x^3}{2}-\dfrac{x^5}{24}-\dfrac{29\cdot x^7}{720}$

$\text{series}\left((1+e^x)^2,x,2,1\right)$
$(e+1)^2+2\cdot e\cdot(e+1)\cdot(x-1)+e\cdot(2\cdot e+1)\cdot(x-1)^2$

Returns a generalized truncated power series representation of *Expr1* expanded about *Point* through degree *Order*. *Order* can be any rational number. The resulting powers of ($Var - Point$) can include negative and/or fractional exponents. The coefficients of these powers can include logarithms of ($Var - Point$) and other functions of *Var* that are dominated by all powers of ($Var - Point$) having the same exponent sign.

Point defaults to 0. *Point* can be ∞ or −∞, in which cases the expansion is through degree *Order* in 1/($Var - Point$).

series(…) returns "**series(…)**" if it is unable to determine such a representation, such as for essential singularities such as sin(1/z) at z=0, $e^{-1/z}$ at z=0, or e^z at z = ∞ or −∞.

If the series or one of its derivatives has a jump discontinuity at *Point*, the result is likely to contain sub-expressions of the form sign(…) or abs(…) for a real expansion variable or (-1)$^{\text{floor}(…\text{angle}(…)…)}$ for a complex expansion variable, which is one ending with "_". If you intend to use the series only for values on one side of *Point*, then append the appropriate one of "| *Var* > *Point*", "| *Var* < *Point*", "| "*Var* ≥ *Point*", or "*Var* ≤ *Point*" to obtain a simpler result.

series() can provide symbolic approximations to indefinite integrals and definite integrals for which symbolic solutions otherwise can't be obtained.

series()	Catalog > ▦

series() distributes over 1st-argument lists and matrices.

series() is a generalized version of **taylor()**.

As illustrated by the last example to the right, the display routines downstream of the result produced by series(...) might rearrange terms so that the dominant term is not the leftmost one.

Note: See also **dominantTerm()**, page 55.

setMode()	Catalog > ▦

setMode(*modeNameInteger***,** *settingInteger***)** ⇒ *integer*
setMode(*list***)** ⇒ *integer list*

Valid only within a function or program.

setMode(*modeNameInteger***,** *settingInteger***)** temporarily sets mode *modeNameInteger* to the new setting *settingInteger*, and returns an integer corresponding to the original setting of that mode. The change is limited to the duration of the program/function's execution.

modeNameInteger specifies which mode you want to set. It must be one of the mode integers from the table below.

settingInteger specifies the new setting for the mode. It must be one of the setting integers listed below for the specific mode you are setting.

setMode(*list***)** lets you change multiple settings. *list* contains pairs of mode integers and setting integers. **setMode(***list***)** returns a similar list whose integer pairs represent the original modes and settings.

If you have saved all mode settings with **getMode(0)**→*var*, you can use **setMode (***var***)** to restore those settings until the function or program exits. See **getMode()**, page 83.

Display approximate value of π using the default setting for Display Digits, and then display π with a setting of Fix2. Check to see that the default is restored after the program executes.

Define *prog1*()=Prgm	*Done*
Disp approx(π)	
setMode(1,16)	
Disp approx(π)	
EndPrgm	

prog1()

	3.14159
	3.14
	Done

setMode()

Note: The current mode settings are passed to called subroutines. If any subroutine changes a mode setting, the mode change will be lost when control returns to the calling routine.

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

Mode Name	Mode Integer	Setting Integers
Display Digits	1	**1**=Float, **2**=Float1, **3**=Float2, **4**=Float3, **5**=Float4, **6**=Float5, **7**=Float6, **8**=Float7, **9**=Float8, **10**=Float9, **11**=Float10, **12**=Float11, **13**=Float12, **14**=Fix0, **15**=Fix1, **16**=Fix2, **17**=Fix3, **18**=Fix4, **19**=Fix5, **20**=Fix6, **21**=Fix7, **22**=Fix8, **23**=Fix9, **24**=Fix10, **25**=Fix11, **26**=Fix12
Angle	2	**1**=Radian, **2**=Degree, **3**=Gradian
Exponential Format	3	**1**=Normal, **2**=Scientific, **3**=Engineering
Real or Complex	4	**1**=Real, **2**=Rectangular, **3**=Polar
Auto or Approx.	5	**1**=Auto, **2**=Approximate, **3**=Exact
Vector Format	6	**1**=Rectangular, **2**=Cylindrical, **3**=Spherical
Base	7	**1**=Decimal, **2**=Hex, **3**=Binary
Unit system	8	**1**=SI, **2**=Eng/US

shift()

shift($Integer1$[**,**$\#ofShifts$]**)** $\Rightarrow$ $integer$

Shifts the bits in a binary integer. You can enter $Integer1$ in any number base; it is converted automatically to a signed, 64-bit binary form. If the magnitude of $Integer1$ is too large for this form, a symmetric modulo operation brings it within the range. For more information, see ►**Base2**, page 17.

In Bin base mode:

$$\text{shift}\left(0b1111010110000110101\right)$$
$$0b111101011000011010$$

$$\text{shift}\left(256,1\right) \qquad 0b1000000000$$

In Hex base mode:

If *#ofShifts* is positive, the shift is to the left. If *#ofShifts* is negative, the shift is to the right. The default is −1 (shift right one bit).

shift(0h78E)	0h3C7
shift(0h78E,-2)	0h1E3
shift(0h78E,2)	0h1E38

In a right shift, the rightmost bit is dropped and 0 or 1 is inserted to match the leftmost bit. In a left shift, the leftmost bit is dropped and 0 is inserted as the rightmost bit.

Important: To enter a binary or hexadecimal number, always use the 0b or 0h prefix (zero, not the letter O).

For example, in a right shift:

Each bit shifts right.

0b0000000000000111101011000011010

Inserts 0 if leftmost bit is 0,
or 1 if leftmost bit is 1.

produces:

0b0000000000000011110101100001101

The result is displayed according to the Base mode. Leading zeros are not shown.

shift(*List1*[**,***#ofShifts*]**)** ⇒ *list*

In Dec base mode:

Returns a copy of *List1* shifted right or left by *#ofShifts* elements. Does not alter *List1*.

shift({1,2,3,4})	{undef,1,2,3}
shift({1,2,3,4},-2)	{undef,undef,1,2}
shift({1,2,3,4},2)	{3,4,undef,undef}

If *#ofShifts* is positive, the shift is to the left. If *#ofShifts* is negative, the shift is to the right. The default is −1 (shift right one element).

Elements introduced at the beginning or end of *list* by the shift are set to the symbol "undef".

shift(*String1*[**,***#ofShifts*]**)** ⇒ *string*

shift("abcd")	" abc"
shift("abcd",-2)	" ab"
shift("abcd",1)	"bcd "

Returns a copy of *String1* shifted right or left by *#ofShifts* characters. Does not alter *String1*.

If *#ofShifts* is positive, the shift is to the left. If *#ofShifts* is negative, the shift is to the right. The default is −1 (shift right one character).

Characters introduced at the beginning or end of *string* by the shift are set to a space.

sign(*Expr1***)** ⇒ *expression*

sign(*List1***)** ⇒ *list*
sign(*Matrix1***)** ⇒ *matrix*

For real and complex *Expr1*, returns *Expr1*/**abs(***Expr1***)** when *Expr1*≠ 0.

Returns 1 if *Expr1* is positive. Returns −1 if *Expr1* is negative.

sign(0) represents the unit circle in the complex domain.

For a list or matrix, returns the signs of all the elements.

$\text{sign}(-3.2)$	$-1.$
$\text{sign}(\{2,3,4,-5\})$	$\{1,1,1,-1\}$
$\text{sign}(1+\lvert x \rvert)$	1

If complex format mode is Real:

$\text{sign}(\begin{bmatrix} -3 & 0 & 3 \end{bmatrix})$	$\begin{bmatrix} -1 & \pm 1 & 1 \end{bmatrix}$

simult(*coeffMatrix***,** *constVector*[**,** *Tol*]**)** ⇒ *matrix*

Returns a column vector that contains the solutions to a system of linear equations.

Note: See also **linSolve()**, page 102.

coeffMatrix must be a square matrix that contains the coefficients of the equations.

constVector must have the same number of rows (same dimension) as *coeffMatrix* and contain the constants.

Optionally, any matrix element is treated as zero if its absolute value is less than *Tol*. This tolerance is used only if the matrix has floating-point entries and does not contain any symbolic variables that have not been assigned a value. Otherwise, *Tol* is ignored.

- If you set the **Auto or Approximate** mode to Approximate, computations are done using floating-point arithmetic.

Solve for x and y:
x + 2y = 1
3x + 4y = −1

$\text{simult}\left(\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}, \begin{bmatrix} 1 \\ -1 \end{bmatrix}\right)$	$\begin{bmatrix} -3 \\ 2 \end{bmatrix}$

The solution is x=−3 and y=2.

Solve:
ax + by = 1
cx + dy = 2

$\begin{bmatrix} a & b \\ c & d \end{bmatrix} \rightarrow matx1$	$\begin{bmatrix} a & b \\ c & d \end{bmatrix}$
$\text{simult}\left(matx1, \begin{bmatrix} 1 \\ 2 \end{bmatrix}\right)$	$\begin{bmatrix} \dfrac{-(2 \cdot b - d)}{a \cdot d - b \cdot c} \\ \dfrac{2 \cdot a - c}{a \cdot d - b \cdot c} \end{bmatrix}$

simult()	**Catalog >** 🔢

- If *Tol* is omitted or not used, the default tolerance is calculated as:
  5E−14 •max(dim(*coeffMatrix*))
  •rowNorm(*coeffMatrix*)

simult(*coeffMatrix***, ***constMatrix***[, ***Tol***])** ⇒ *matrix*

Solves multiple systems of linear equations, where each system has the same equation coefficients but different constants.

Each column in *constMatrix* must contain the constants for a system of equations. Each column in the resulting matrix contains the solution for the corresponding system.

Solve:
  x + 2y = 1
  3x + 4y = −1

  x + 2y = 2
  3x + 4y = −3

$$\text{simult}\left(\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}, \begin{bmatrix} 1 & 2 \\ -1 & -3 \end{bmatrix}\right) \qquad \begin{bmatrix} -3 & -7 \\ 2 & \dfrac{9}{2} \end{bmatrix}$$

For the first system, x=−3 and y=2. For the second system, x=−7 and y=9/2.

►sin	**Catalog >** 🔢

Expr►**sin**

Note: You can insert this operator from the computer keyboard by typing @>**sin**.

Represents *Expr* in terms of sine. This is a display conversion operator. It can be used only at the end of the entry line.

►**sin** reduces all powers of
  cos(...) modulo 1−sin(...)^2
so that any remaining powers of sin(...) have exponents in the range (0, 2). Thus, the result will be free of cos(...) if and only if cos(...) occurs in the given expression only to even powers.

Note: This conversion operator is not supported in Degree or Gradian Angle modes. Before using it, make sure that the Angle mode is set to Radians and that *Expr* does not contain explicit references to degree or gradian angles.

$$(\cos(x))^2 ►\sin \qquad 1-(\sin(x))^2$$

sin()	🔤 **key**

sin(*Expr1***)** ⇒ *expression*

In Degree angle mode:

sin()

sin(*List1***)** ⇒ *list*

sin(*Expr1***)** returns the sine of the argument as an expression.

sin(*List1***)** returns a list of the sines of all elements in *List1*.

Note: The argument is interpreted as a degree, gradian or radian angle, according to the current angle mode. You can use °, ᵍ, or ʳ to override the angle mode setting temporarily.

$\sin\left(\dfrac{\pi}{4}\,r\right)$	$\dfrac{\sqrt{2}}{2}$
$\sin(45)$	$\dfrac{\sqrt{2}}{2}$
$\sin(\{0,60,90\})$	$\left\{0,\dfrac{\sqrt{3}}{2},1\right\}$

In Gradian angle mode:

$\sin(50)$	$\dfrac{\sqrt{2}}{2}$

In Radian angle mode:

$\sin\left(\dfrac{\pi}{4}\right)$	$\dfrac{\sqrt{2}}{2}$
$\sin(45°)$	$\dfrac{\sqrt{2}}{2}$

sin(*squareMatrix1***)** ⇒ *squareMatrix*

Returns the matrix sine of *squareMatrix1*. This is not the same as calculating the sine of each element. For information about the calculation method, refer to **cos()**.

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

In Radian angle mode:

$$\sin\left(\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}\right)$$

$$\begin{bmatrix} 0.9424 & -0.04542 & -0.031999 \\ -0.045492 & 0.949254 & -0.020274 \\ -0.048739 & -0.00523 & 0.961051 \end{bmatrix}$$

sin⁻¹()

sin⁻¹(*Expr1***)** ⇒ *expression*

sin⁻¹(*List1***)** ⇒ *list*

sin⁻¹(*Expr1***)** returns the angle whose sine is *Expr1* as an expression.

sin⁻¹(*List1***)** returns a list of the inverse sines of each element of *List1*.

Note: The result is returned as a degree, gradian or radian angle, according to the current angle mode setting.

In Degree angle mode:

$\sin^{-1}(1)$	90

In Gradian angle mode:

$\sin^{-1}(1)$	100

In Radian angle mode:

$\sin^{-1}(\{0,0.2,0.5\})$	$\{0,0.201358,0.523599\}$

sin⁻¹()

Note: You can insert this function from the keyboard by typing `arcsin(...)`.

sin⁻¹(*squareMatrix1***)** ⇒ *squareMatrix*

Returns the matrix inverse sine of *squareMatrix1*. This is not the same as calculating the inverse sine of each element. For information about the calculation method, refer to **cos()**.

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

In Radian angle mode and Rectangular complex format mode:

$$\sin^{-1}\begin{bmatrix} 1 & 5 \\ 4 & 2 \end{bmatrix}$$
$$\begin{bmatrix} -0.174533-0.12198\cdot i & 1.74533-2.35591\cdot i \\ 1.39626-1.88473\cdot i & 0.174533-0.593162\cdot i \end{bmatrix}$$

sinh()

sinh(*Expr1***)** ⇒ *expression*

sinh(*List1***)** ⇒ *list*

sinh (*Expr1***)** returns the hyperbolic sine of the argument as an expression.

sinh (*List1***)** returns a list of the hyperbolic sines of each element of *List1*.

$$\sinh(1.2) \qquad 1.50946$$
$$\sinh(\{0,1.2,3.\}) \qquad \{0,1.50946,10.0179\}$$

sinh(*squareMatrix1***)** ⇒ *squareMatrix*

Returns the matrix hyperbolic sine of *squareMatrix1*. This is not the same as calculating the hyperbolic sine of each element. For information about the calculation method, refer to **cos()**.

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

In Radian angle mode:

$$\sinh\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}$$
$$\begin{bmatrix} 360.954 & 305.708 & 239.604 \\ 352.912 & 233.495 & 193.564 \\ 298.632 & 154.599 & 140.251 \end{bmatrix}$$

sinh⁻¹()

sinh⁻¹(*Expr1***)** ⇒ *expression*

sinh⁻¹(*List1***)** ⇒ *list*

sinh⁻¹(*Expr1***)** returns the inverse hyperbolic sine of the argument as an expression.

sinh⁻¹(*List1***)** returns a list of the inverse hyperbolic sines of each element of *List1*.

$$\sinh^{-1}(0) \qquad 0$$
$$\sinh^{-1}(\{0,2.1,3\}) \qquad \{0,1.48748,\sinh^{-1}(3)\}$$

sinh⁻¹()	**Catalog >** 📖

Note: You can insert this function from the keyboard by typing **arcsinh(...)**.

$\sinh^{-1}($*squareMatrix1*$) \Rightarrow$ *squareMatrix*

In Radian angle mode:

Returns the matrix inverse hyperbolic sine of *squareMatrix1*. This is not the same as calculating the inverse hyperbolic sine of each element. For information about the calculation method, refer to **cos()**.

$$\sinh^{-1}\left(\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}\right)$$

$$\begin{bmatrix} 0.041751 & 2.15557 & 1.1582 \\ 1.46382 & 0.926568 & 0.112557 \\ 2.75079 & -1.5283 & 0.57268 \end{bmatrix}$$

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

SinReg	**Catalog >** 📖

SinReg *X*, *Y*[, [*Iterations*],[*Period*][, *Category*, *Include*]]

Computes the sinusoidal regression on lists *X* and *Y*. A summary of results is stored in the *stat.results* variable. (See page 176.)

All the lists must have equal dimension except for *Include*.

X and *Y* are lists of independent and dependent variables.

Iterations is a value that specifies the maximum number of times (1 through 16) a solution will be attempted. If omitted, 8 is used. Typically, larger values result in better accuracy but longer execution times, and vice versa.

Period specifies an estimated period. If omitted, the difference between values in *X* should be equal and in sequential order. If you specify *Period*, the differences between x values can be unequal.

Category is a list of category codes for the corresponding *X* and *Y* data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

SinReg

The output of **SinReg** is always in radians, regardless of the angle mode setting.

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.RegEqn	Regression Equation: a•sin(bx+c)+d
stat.a, stat.b, stat.c, stat.d	Regression coefficients
stat.Resid	Residuals from the regression
stat.XReg	List of data points in the modified *X List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.YReg	List of data points in the modified *Y List* actually used in the regression based on restrictions of *Freq*, *Category List*, and *Include Categories*
stat.FreqReg	List of frequencies corresponding to *stat.XReg* and *stat.YReg*

solve()

solve(*Equation***,** *Var***)** ⇒ *Boolean expression*
solve(*Equation***,** *Var=Guess***)** ⇒ *Boolean expression*
solve(*Inequality***,** *Var***)** ⇒ *Boolean expression*

Returns candidate real solutions of an equation or an inequality for *Var*. The goal is to return candidates for all solutions. However, there might be equations or inequalities for which the number of solutions is infinite.

Solution candidates might not be real finite solutions for some combinations of values for undefined variables.

$$\text{solve}\left(a \cdot x^2 + b \cdot x + c = 0, x\right)$$
$$x = \frac{\sqrt{b^2 - 4 \cdot a \cdot c} - b}{2 \cdot a} \text{ or } x = \frac{-\left(\sqrt{b^2 - 4 \cdot a \cdot c} + b\right)}{2 \cdot a}$$

$$Ans | a = 1 \text{ and } b = 1 \text{ and } c = 1$$
$$x = \frac{-1}{2} + \frac{\sqrt{3}}{2} \cdot i \text{ or } x = \frac{-1}{2} - \frac{\sqrt{3}}{2} \cdot i$$

For the Auto setting of the **Auto or Approximate** mode, the goal is to produce exact solutions when they are concise, and supplemented by iterative searches with approximate arithmetic when exact solutions are impractical.

$$\text{solve}\big((x-a)\cdot \mathbf{e}^x = -x\cdot(x-a),x\big)$$
$$x=a \text{ or } x=\text{-}0.567143$$

Due to default cancellation of the greatest common divisor from the numerator and denominator of ratios, solutions might be solutions only in the limit from one or both sides.

$$(x+1)\cdot\frac{x-1}{x-1}+x-3 \qquad\qquad 2\cdot x-2$$

For inequalities of types $\geq$, $\leq$, $<$, or $>$, explicit solutions are unlikely unless the inequality is linear and contains only Var.

$$\text{solve}(5\cdot x-2\geq 2\cdot x,x) \qquad\qquad x\geq\frac{2}{3}$$

For the Exact mode, portions that cannot be solved are returned as an implicit equation or inequality.

$$\text{exact}\big(\text{solve}\big((x-a)\cdot e^x = -x\cdot(x-a),x\big)\big)$$
$$e^x+x=0 \text{ or } x=a$$

Use the constraint ("|") operator to restrict the solution interval and/or other variables that occur in the equation or inequality. When you find a solution in one interval, you can use the inequality operators to exclude that interval from subsequent searches.

In Radian angle mode:

$$\text{solve}\Big(\tan(x)=\frac{1}{x},x\Big)\big| x>0 \text{ and } x<1$$
$$x=0.860334$$

false is returned when no real solutions are found. true is returned if **solve()** can determine that any finite real value of Var satisfies the equation or inequality.

$$\text{solve}(x=x+1,x) \qquad\qquad \text{false}$$
$$\text{solve}(x=x,x) \qquad\qquad \text{true}$$

Since **solve()** always returns a Boolean result, you can use "and," "or," and "not" to combine results from **solve()** with each other or with other Boolean expressions.

$$2\cdot x-1\leq 1 \text{ and } \text{solve}\big(x^2\neq 9,x\big) \quad x\neq\text{-}3 \text{ and } x\leq 1$$

Solutions might contain a unique new undefined constant of the form $\mathbf{n}j$ with j being an integer in the interval 1–255. Such variables designate an arbitrary integer.

In Radian angle mode:

$$\text{solve}(\sin(x)=0,x) \qquad\qquad x=\mathbf{n}1\cdot\pi$$

In Real mode, fractional powers having odd denominators denote only the real branch. Otherwise, multiple branched expressions such as fractional powers, logarithms, and inverse trigonometric functions denote only the principal branch. Consequently, **solve()** produces only solutions corresponding to that one real or principal branch.

$$\text{solve}\left(x^{\frac{1}{3}}=-1,x\right) \qquad\qquad x=-1$$

$$\text{solve}\left(\sqrt{x}=-2,x\right) \qquad\qquad \text{false}$$

$$\text{solve}\left(-\sqrt{x}=-2,x\right) \qquad\qquad x=4$$

Note: See also **cSolve()**, **cZeros()**, **nSolve()**, and **zeros()**.

solve(_Eqn1_ **and** _Eqn2_[**and** ...]**,** _VarOrGuess1_, _VarOrGuess2_[, ...]**)** ⇒ _Boolean expression_

$$\text{solve}\left(y=x^2-2 \text{ and } x+2\cdot y=-1,\{x,y\}\right)$$
$$x=\frac{-3}{2} \text{ and } y=\frac{1}{4} \text{ or } x=1 \text{ and } y=-1$$

solve(_SystemOfEqns_, _VarOrGuess1_, _VarOrGuess2_[, ...]**)** ⇒ _Boolean expression_

solve({_Eqn1_, _Eqn2_ [,...]} {_VarOrGuess1_,_VarOrGuess2_ [, ...]}**)** ⇒ _Boolean expression_

Returns candidate real solutions to the simultaneous algebraic equations, where each _VarOrGuess_ specifies a variable that you want to solve for.

You can separate the equations with the **and** operator, or you can enter a _SystemOfEqns_ using a template from the Catalog. The number of _VarOrGuess_ arguments must match the number of equations. Optionally, you can specify an initial guess for a variable. Each _VarOrGuess_ must have the form:

variable
– or –
variable = real or non-real number

For example, x is valid and so is x=3.

If all of the equations are polynomials and if you do NOT specify any initial guesses, **solve()** uses the lexical Gröbner/Buchberger elimination method to attempt to determine all real solutions.

For example, suppose you have a circle of radius r at the origin and another circle of radius r centered where the first circle crosses the positive x-axis. Use **solve()** to find the intersections.

As illustrated by r in the example to the right, simultaneous polynomial equations can have extra variables that have no values, but represent given numeric values that could be substituted later.

You can also (or instead) include solution variables that do not appear in the equations. For example, you can include z as a solution variable to extend the previous example to two parallel intersecting cylinders of radius r.

The cylinder solutions illustrate how families of solutions might contain arbitrary constants of the form c_k, where k is an integer suffix from 1 through 255.

For polynomial systems, computation time or memory exhaustion may depend strongly on the order in which you list solution variables. If your initial choice exhausts memory or your patience, try rearranging the variables in the equations and/or *varOrGuess* list.

If you do not include any guesses and if any equation is non-polynomial in any variable but all equations are linear in the solution variables, **solve()** uses Gaussian elimination to attempt to determine all real solutions.

$$\mathrm{solve}\!\left(x^2+y^2=r^2 \text{ and} (x-r)^2+y^2=r^2, \{x,y\}\right)$$
$$x=\frac{r}{2} \text{ and } y=\frac{\sqrt{3}\cdot r}{2} \text{ or } x=\frac{r}{2} \text{ and } y=\frac{-\sqrt{3}\cdot r}{2}$$

$$\mathrm{solve}\!\left(x^2+y^2=r^2 \text{ and} (x-r)^2+y^2=r^2, \{x,y,z\}\right)$$
$$x=\frac{r}{2} \text{ and } y=\frac{\sqrt{3}\cdot r}{2} \text{ and } z=c1 \text{ or } x=\frac{r}{2} \text{ and } y \rightarrow$$

To see the entire result,
press ▲ and then use ◀ and ▶ to move the cursor.

$$\mathrm{solve}\!\left(x+e^z\cdot y=1 \text{ and } x-y=\sin(z), \{x,y\}\right)$$
$$x=\frac{e^z\cdot\sin(z)+1}{e^z+1} \text{ and } y=\frac{-(\sin(z)-1)}{e^z+1}$$

solve()

If a system is neither polynomial in all of its variables nor linear in its solution variables, **solve()** determines at most one solution using an approximate iterative method. To do so, the number of solution variables must equal the number of equations, and all other variables in the equations must simplify to numbers.

Each solution variable starts at its guessed value if there is one; otherwise, it starts at 0.0.

Use guesses to seek additional solutions one by one. For convergence, a guess may have to be rather close to a solution.

$$\text{solve}\left(e^{z} \cdot y=1 \text{ and } -y=\sin(z),\{y,z\}\right)$$
$$y=2.812\text{E}^-10 \text{ and } z=21.9911 \text{ or } y=0.001871▸$$

To see the entire result,
press ▲ and then use ◄ and ► to move the cursor.

$$\text{solve}\left(e^{z} \cdot y=1 \text{ and } -y=\sin(z),\{y,z=2 \cdot \pi\}\right)$$
$$y=0.001871 \text{ and } z=6.28131$$

SortA

SortA *List1*[**,** *List2*] [**,** *List3*]...
SortA *Vector1*[**,** *Vector2*] [**,** *Vector3*]...

Sorts the elements of the first argument in ascending order.

If you include additional arguments, sorts the elements of each so that their new positions match the new positions of the elements in the first argument.

All arguments must be names of lists or vectors. All arguments must have equal dimensions.

Empty (void) elements within the first argument move to the bottom. For more information on empty elements, see page 251.

$\{2,1,4,3\} \rightarrow list1$	$\{2,1,4,3\}$
SortA *list1*	*Done*
list1	$\{1,2,3,4\}$
$\{4,3,2,1\} \rightarrow list2$	$\{4,3,2,1\}$
SortA *list2,list1*	*Done*
list2	$\{1,2,3,4\}$
list1	$\{4,3,2,1\}$

SortD *List1*[*,* *List2*][*,* *List3*]...
SortD *Vector1*[*,Vector2*][*,Vector3*]...

Identical to **SortA**, except **SortD** sorts the elements in descending order.

Empty (void) elements within the first argument move to the bottom. For more information on empty elements, see page 251.

$\{2,1,4,3\} \to list1$	$\{2,1,4,3\}$
$\{1,2,3,4\} \to list2$	$\{1,2,3,4\}$
SortD $list1,list2$	*Done*
$list1$	$\{4,3,2,1\}$
$list2$	$\{3,4,1,2\}$

Vector►**Sphere**

Note: You can insert this operator from the computer keyboard by typing @>**Sphere**.

Displays the row or column vector in spherical form [ρ∠θ∠φ].

Vector must be of dimension 3 and can be either a row or a column vector.

Note: ►**Sphere** is a display-format instruction, not a conversion function. You can use it only at the end of an entry line.

Note: To force an approximate result,

Handheld: Press ctrl enter.
Windows®: Press **Ctrl+Enter**.
Macintosh®: Press ⌘+**Enter**.
iPad®: Hold **enter**, and select ≈ .

$$\begin{bmatrix}1 & 2 & 3\end{bmatrix} \blacktriangleright \text{Sphere}$$
$$\begin{bmatrix}3.74166 & \angle 1.10715 & \angle 0.640522\end{bmatrix}$$

$$\left(\begin{bmatrix}2 & \angle \dfrac{\pi}{4} & 3\end{bmatrix}\right) \blacktriangleright \text{Sphere}$$
$$\begin{bmatrix}3.60555 & \angle 0.785398 & \angle 0.588003\end{bmatrix}$$

Press enter

$$\left(\begin{bmatrix}2 & \angle \dfrac{\pi}{4} & 3\end{bmatrix}\right) \blacktriangleright \text{Sphere}$$
$$\begin{bmatrix}\sqrt{13} & \angle \dfrac{\pi}{4} & \angle \sin^{-1}\left(\dfrac{2\cdot\sqrt{13}}{13}\right)\end{bmatrix}$$

sqrt()

sqrt($Expr1$**)** $\Rightarrow$ *expression*

sqrt($List1$**)** $\Rightarrow$ *list*

Returns the square root of the argument.

For a list, returns the square roots of all the elements in $List1$.

Note: See also **Square root template**, page 1.

$\sqrt{4}$	2
$\sqrt{\{9,a,4\}}$	$\left\{3,\sqrt{a},2\right\}$

stat.results

stat.results

Displays results from a statistics calculation.

The results are displayed as a set of name-value pairs. The specific names shown are dependent on the most recently evaluated statistics function or command.

You can copy a name or value and paste it into other locations.

Note: Avoid defining variables that use the same names as those used for statistical analysis. In some cases, an error condition could occur. Variable names used for statistical analysis are listed in the table below.

$xlist:=\{1,2,3,4,5\}$	$\{1,2,3,4,5\}$
$ylist:=\{4,8,11,14,17\}$	$\{4,8,11,14,17\}$

LinRegMx $xlist,ylist,1$: *stat.results*

Note: Each time the Lists & Spreadsheet application calculates statistical results, it copies the "stat**.**" group variables to a "stat#**.**" group, where # is a number that is incremented automatically. This lets you maintain previous results while performing multiple calculations.

stat.values	Catalog > 📖

stat.values	See the **stat.results** example.
Displays a matrix of the values calculated for the most recently evaluated statistics function or command.	
Unlike **stat.results**, **stat.values** omits the names associated with the values.	
You can copy a value and paste it into other locations.	

stDevPop()

stDevPop(_List_ [**,** _freqList_]**)** ⇒ _expression_

Returns the population standard deviation of the elements in _List_.

Each _freqList_ element counts the number of consecutive occurrences of the corresponding element in _List_.

Note:_List_ must have at least two elements. Empty (void) elements are ignored. For more information on empty elements, see page 251.

In Radian angle and auto modes:

$$\text{stDevPop}(\{a,b,c\})$$
$$\frac{\sqrt{2\cdot\left(a^2-a\cdot(b+c)+b^2-b\cdot c+c^2\right)}}{3}$$
$$\text{stDevPop}(\{1,2,5,-6,3,-2\}) \qquad \frac{\sqrt{465}}{6}$$
$$\text{stDevPop}(\{1.3,2.5,-6.4\},\{3,2,5\}) \quad 4.11107$$

stDevPop(_Matrix1_[**,** _freqMatrix_]**)** ⇒ _matrix_

Returns a row vector of the population standard deviations of the columns in _Matrix1_.

Each _freqMatrix_ element counts the number of consecutive occurrences of the corresponding element in _Matrix1_.

Note:_Matrix1_must have at least two rows. Empty (void) elements are ignored. For more information on empty elements, see page 251.

$$\text{stDevPop}\left(\begin{bmatrix} 1 & 2 & 5 \\ -3 & 0 & 1 \\ 5 & 7 & 3 \end{bmatrix}\right) \quad \begin{bmatrix} \dfrac{4\cdot\sqrt{6}}{3} & \dfrac{\sqrt{78}}{3} & \dfrac{2\cdot\sqrt{6}}{3} \end{bmatrix}$$

$$\text{stDevPop}\left(\begin{bmatrix} -1.2 & 5.3 \\ 2.5 & 7.3 \\ 6 & -4 \end{bmatrix},\begin{bmatrix} 4 & 2 \\ 3 & 3 \\ 1 & 7 \end{bmatrix}\right)$$
$$\begin{bmatrix} 2.52608 & 5.21506 \end{bmatrix}$$

stDevSamp()

stDevSamp(_List_[**,** _freqList_]**)** ⇒ _expression_

Returns the sample standard deviation of the elements in _List_.

Each _freqList_ element counts the number of consecutive occurrences of the corresponding element in _List_.

Note:_List_ must have at least two elements. Empty (void) elements are ignored. For more information on empty elements, see page 251.

$$\text{stDevSamp}(\{a,b,c\})$$
$$\frac{\sqrt{3\cdot\left(a^2-a\cdot(b+c)+b^2-b\cdot c+c^2\right)}}{3}$$
$$\text{stDevSamp}(\{1,2,5,-6,3,-2\}) \qquad \frac{\sqrt{62}}{2}$$
$$\text{stDevSamp}(\{1.3,2.5,-6.4\},\{3,2,5\})$$
$$4.33345$$

stDevSamp()

stDevSamp(*Matrix1*[**,** *freqMatrix*]**)** ⇒ *matrix*

Returns a row vector of the sample standard deviations of the columns in *Matrix1*.

Each *freqMatrix* element counts the number of consecutive occurrences of the corresponding element in *Matrix1*.

Note: *Matrix1* must have at least two rows. Empty (void) elements are ignored. For more information on empty elements, see page 251.

$$\text{stDevSamp}\left(\begin{bmatrix} 1 & 2 & 5 \\ -3 & 0 & 1 \\ 5 & 7 & 3 \end{bmatrix}\right) \quad \begin{bmatrix} 4 & \sqrt{13} & 2 \end{bmatrix}$$

$$\text{stDevSamp}\left(\begin{bmatrix} -1.2 & 5.3 \\ 2.5 & 7.3 \\ 6 & -4 \end{bmatrix}, \begin{bmatrix} 4 & 2 \\ 3 & 3 \\ 1 & 7 \end{bmatrix}\right)$$
$$\begin{bmatrix} 2.7005 & 5.44695 \end{bmatrix}$$

Stop

Stop

Programming command: Terminates the program.

Stop is not allowed in functions.

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

$i:=0$	0
Define $prog1()=$Prgm	*Done*
For $i,1,10,1$	
If $i=5$	
Stop	
EndFor	
EndPrgm	
$prog1()$	*Done*
i	5

Store

See →(store), page 233.

string()

string(*Expr***)** ⇒ *string*

Simplifies *Expr* and returns the result as a character string.

$\text{string}(1.2345)$	"1.2345"
$\text{string}(1+2)$	"3"
$\text{string}(\cos(x)+\sqrt{3})$	"cos(x)+√(3)"

subMat()

Catalog > 📖

subMat(*Matrix1*[*, startRow*][*, startCol*][*, endRow*][*, endCol*]**)** ⇒ *matrix*

Returns the specified submatrix of *Matrix1*.

Defaults: *startRow*=1, *startCol*=1, *endRow*=last row, *endCol*=last column.

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix} \to m1 \qquad \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}$$

$$\text{subMat}(m1,2,1,3,2) \qquad \begin{bmatrix} 4 & 5 \\ 7 & 8 \end{bmatrix}$$

$$\text{subMat}(m1,2,2) \qquad \begin{bmatrix} 5 & 6 \\ 8 & 9 \end{bmatrix}$$

Sum (Sigma)

See Σ(), page 224.

sum()

Catalog > 📖

sum(*List*[*, Start*[*, End*]]**)** ⇒ *expression*

Returns the sum of all elements in *List*.

Start and *End* are optional. They specify a range of elements.

Any void argument produces a void result. Empty (void) elements in *List* are ignored. For more information on empty elements, see page 251.

$$\text{sum}(\{1,2,3,4,5\}) \qquad 15$$
$$\text{sum}(\{a,2 \cdot a,3 \cdot a\}) \qquad 6 \cdot a$$
$$\text{sum}(\text{seq}(n,n,1,10)) \qquad 55$$
$$\text{sum}(\{1,3,5,7,9\},3) \qquad 21$$

sum(*Matrix1*[*, Start*[*, End*]]**)** ⇒ *matrix*

Returns a row vector containing the sums of all elements in the columns in *Matrix1*.

Start and *End* are optional. They specify a range of rows.

Any void argument produces a void result. Empty (void) elements in *Matrix1* are ignored. For more information on empty elements, see page 251.

$$\text{sum}\left(\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}\right) \qquad [5 \quad 7 \quad 9]$$

$$\text{sum}\left(\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}\right) \qquad [12 \quad 15 \quad 18]$$

$$\text{sum}\left(\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix},2,3\right) \qquad [11 \quad 13 \quad 15]$$

sumIf()

Catalog > 📖

sumIf(*List*,*Criteria*[*, SumList*]**)** ⇒ *value*

Returns the accumulated sum of all elements in *List* that meet the specified *Criteria*. Optionally, you can specify an alternate list, *sumList*, to supply the elements to accumulate.

$$\text{sumIf}(\{1,2,e,3,\pi,4,5,6\},2.5<?<4.5)$$
$$e+\pi+7$$
$$\text{sumIf}(\{1,2,3,4\},2<?<5,\{10,20,30,40\})$$
$$70$$

List can be an expression, list, or matrix. *SumList*, if specified, must have the same dimension(s) as *List*.

Criteria can be:

- A value, expression, or string. For example, **34** accumulates only those elements in *List* that simplify to the value 34.
- A Boolean expression containing the symbol **?** as a placeholder for each element. For example, **?<10** accumulates only those elements in *List* that are less than 10.

When a *List* element meets the *Criteria*, the element is added to the accumulating sum. If you include *sumList*, the corresponding element from *sumList* is added to the sum instead.

Within the Lists & Spreadsheet application, you can use a range of cells in place of *List* and *sumList*.

Empty (void) elements are ignored. For more information on empty elements, see page 251.

Note: See also **countIf()**, page 35.

system(*Eqn1*[**,** *Eqn2*[**,** *Eqn3*[**,** …]]]**)**

system(*Expr1*[**,** *Expr2*[**,** *Expr3*[**,** …]]]**)**

Returns a system of equations, formatted as a list. You can also create a system by using a template.

Note: See also **System of equations**, page 3.

$$\text{solve}\left\{\begin{cases} x+y=0 \\ x-y=8 \end{cases}, x, y\right\} \qquad x=4 \text{ and } y=-4$$

T (transpose)   Catalog > 📖

*Matrix1*T ⇒ *matrix*

Returns the complex conjugate transpose of *Matrix1*.

Note: You can insert this operator from the computer keyboard by typing @t.

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}^\mathsf{T} \qquad \begin{bmatrix} 1 & 4 & 7 \\ 2 & 5 & 8 \\ 3 & 6 & 9 \end{bmatrix}$$

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix}^\mathsf{T} \qquad \begin{bmatrix} a & c \\ b & d \end{bmatrix}$$

$$\begin{bmatrix} 1+i & 2+i \\ 3+i & 4+i \end{bmatrix}^\mathsf{T} \qquad \begin{bmatrix} 1-i & 3-i \\ 2-i & 4-i \end{bmatrix}$$

tan()   ⌊trig⌋ key

tan(*Expr1***)** ⇒ *expression*

tan(*List1***)** ⇒ *list*

tan(*Expr1***)** returns the tangent of the argument as an expression.

tan(*List1***)** returns a list of the tangents of all elements in *List1*.

Note: The argument is interpreted as a degree, gradian or radian angle, according to the current angle mode. You can use °, ᵍ or ʳ to override the angle mode setting temporarily.

In Degree angle mode:

$$\tan\left(\frac{\pi}{4}{}_r\right) \qquad 1$$
$$\tan(45) \qquad 1$$
$$\tan(\{0,60,90\}) \qquad \{0,\sqrt{3},\text{undef}\}$$

In Gradian angle mode:

$$\tan\left(\frac{\pi}{4}{}_r\right) \qquad 1$$
$$\tan(50) \qquad 1$$
$$\tan(\{0,50,100\}) \qquad \{0,1,\text{undef}\}$$

In Radian angle mode:

$$\tan\left(\frac{\pi}{4}\right) \qquad 1$$
$$\tan(45°) \qquad 1$$
$$\tan\left(\left\{\pi,\frac{\pi}{3},-\pi,\frac{\pi}{4}\right\}\right) \qquad \{0,\sqrt{3},0,1\}$$

tan(*squareMatrix1***)** ⇒ *squareMatrix*

Returns the matrix tangent of *squareMatrix1*. This is not the same as calculating the tangent of each element. For information about the calculation method, refer to **cos()**.

In Radian angle mode:

$$\tan\left(\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}\right)$$
$$\begin{bmatrix} -28.2912 & 26.0887 & 11.1142 \\ 12.1171 & -7.83536 & -5.48138 \\ 36.8181 & -32.8063 & -10.4594 \end{bmatrix}$$

tan()

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

tan⁻¹()

tan⁻¹(*Expr1***)** ⇒ *expression*

tan⁻¹(*List1***)** ⇒ *list*

tan⁻¹(*Expr1***)** returns the angle whose tangent is *Expr1* as an expression.

tan⁻¹(*List1***)** returns a list of the inverse tangents of each element of *List1*.

Note: The result is returned as a degree, gradian or radian angle, according to the current angle mode setting.

Note: You can insert this function from the keyboard by typing **arctan(**...**)**.

tan⁻¹(*squareMatrix1***)** ⇒ *squareMatrix*

Returns the matrix inverse tangent of *squareMatrix1*. This is not the same as calculating the inverse tangent of each element. For information about the calculation method, refer to **cos()**.

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

In Degree angle mode:

$$\tan^{-1}(1) \qquad\qquad 45$$

In Gradian angle mode:

$$\tan^{-1}(1) \qquad\qquad 50$$

In Radian angle mode:

$$\tan^{-1}(\{0,0.2,0.5\}) \qquad \{0,0.197396,0.463648\}$$

In Radian angle mode:

$$\tan^{-1}\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}$$
$$\begin{bmatrix} -0.083658 & 1.26629 & 0.62263 \\ 0.748539 & 0.630015 & -0.070012 \\ 1.68608 & -1.18244 & 0.455126 \end{bmatrix}$$

tangentLine()

tangentLine(*Expr1***,***Var***,***Point***)** ⇒ *expression*

tangentLine(*Expr1***,***Var=Point***)** ⇒ *expression*

Returns the tangent line to the curve represented by *Expr1* at the point specified in *Var=Point*.

$$\text{tangentLine}(x^2,x,1) \qquad\qquad 2\cdot x - 1$$

$$\text{tangentLine}((x-3)^2 - 4, x, 3) \qquad\qquad -4$$

$$\text{tangentLine}\left(x^{\frac{1}{3}}, x=0\right) \qquad\qquad x=0$$

$$\text{tangentLine}(\sqrt{x^2-4}, x=2) \qquad\qquad \text{undef}$$

$$x:=3: \text{tangentLine}(x^2,x,1) \qquad\qquad 5$$

tangentLine()

Make sure that the independent variable is not defined. For example, If f1(x):=5 and x:=3, then **tangentLine(**f1(x),x,**2)** returns "false."

tanh()

tanh(*Expr1***)** ⇒ *expression*

$\tanh(1.2)$ 0.833655

tanh(*List1***)** ⇒ *list*

$\tanh(\{0,1\})$ $\{0,\tanh(1)\}$

tanh(*Expr1***)** returns the hyperbolic tangent of the argument as an expression.

tanh(*List1***)** returns a list of the hyperbolic tangents of each element of *List1*.

tanh(*squareMatrix1***)** ⇒ *squareMatrix*

In Radian angle mode:

Returns the matrix hyperbolic tangent of *squareMatrix1*. This is not the same as calculating the hyperbolic tangent of each element. For information about the calculation method, refer to **cos()**.

$$\tanh\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}$$
$$\begin{bmatrix} -0.097966 & 0.933436 & 0.425972 \\ 0.488147 & 0.538881 & -0.129382 \\ 1.28295 & -1.03425 & 0.428817 \end{bmatrix}$$

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

tanh⁻¹()

tanh⁻¹(*Expr1***)** ⇒ *expression*

In Rectangular complex format:

tanh⁻¹(*List1***)** ⇒ *list*

$\tanh^{-1}(0)$ 0

tanh⁻¹(*Expr1***)** returns the inverse hyperbolic tangent of the argument as an expression.

$\tanh^{-1}(\{1,2.1,3\})$
$$\left\{ \text{undef}, 0.518046 - 1.5708 \cdot \boldsymbol{i}, \frac{\ln(2)}{2} - \frac{\pi}{2} \cdot \boldsymbol{i} \right\}$$

tanh⁻¹(*List1***)** returns a list of the inverse hyperbolic tangents of each element of *List1*.

Note: You can insert this function from the keyboard by typing **arctanh(**...**)**.

tanh⁻¹(*squareMatrix1***)** ⇒ *squareMatrix*

In Radian angle mode and Rectangular complex format:

tanh⁻¹()

Returns the matrix inverse hyperbolic tangent of *squareMatrix1*. This is not the same as calculating the inverse hyperbolic tangent of each element. For information about the calculation method, refer to **cos ()**.

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

$$\tanh^{-1}\left(\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}\right)$$

$$\begin{bmatrix} -0.099353+0.164058 \cdot i & 0.267834-1.4908 \\ -0.087596-0.725533 \cdot i & 0.479679-0.94730 \\ 0.511463-2.08316 \cdot i & -0.878563+1.7901 \end{bmatrix}$$

To see the entire result,
press ▲ and then use ◄ and ► to move the cursor.

taylor()

taylor(Expr1**,** Var**,** Order[**,** Point]**)** ⇒ *expression*

Returns the requested Taylor polynomial. The polynomial includes non-zero terms of integer degrees from zero through *Order* in (*Var* minus *Point*). **taylor()** returns itself if there is no truncated power series of this order, or if it would require negative or fractional exponents. Use substitution and/or temporary multiplication by a power of (*Var* minus *Point*) to determine more general power series.

Point defaults to zero and is the expansion point.

$\text{taylor}\left(e^{\sqrt{x}},x,2\right)$ $\text{taylor}\left(e^{\sqrt{x}},x,2,0\right)$

$\text{taylor}\left(e^{t},t,4\right)|t=\sqrt{x}$

$$\frac{x^2}{24}+\frac{x^{\frac{3}{2}}}{6}+\frac{x}{2}+\sqrt{x}+1$$

$\text{taylor}\left(\dfrac{1}{x \cdot (x-1)},x,3\right)$ $\text{taylor}\left(\dfrac{1}{x \cdot (x-1)},x,3,0\right)$

$$\text{expand}\left(\dfrac{\text{taylor}\left(\dfrac{x}{x \cdot (x-1)},x,4\right)}{x},x\right)$$

$$-x^3-x^2-x-\frac{1}{x}-1$$

tCdf()

tCdf(lowBound**,**upBound**,**df**)** ⇒ *number* if *lowBound* and *upBound* are numbers, *list* if *lowBound* and *upBound* are lists

Computes the Student-*t* distribution probability between *lowBound* and *upBound* for the specified degrees of freedom *df*.

For P(X ≤ *upBound*), set *lowBound* = ⁻∞.

tCollect()

tCollect(*Expr1***)** ⇒ *expression*

Returns an expression in which products and integer powers of sines and cosines are converted to a linear combination of sines and cosines of multiple angles, angle sums, and angle differences. The transformation converts trigonometric polynomials into a linear combination of their harmonics.

$\text{tCollect}\left((\cos(\alpha))^2\right)$	$\dfrac{\cos(2\cdot\alpha)+1}{2}$
$\text{tCollect}(\sin(\alpha)\cdot\cos(\beta))$	$\dfrac{\sin(\alpha-\beta)+\sin(\alpha+\beta)}{2}$

Sometimes **tCollect()** will accomplish your goals when the default trigonometric simplification does not. **tCollect()** tends to reverse transformations done by **tExpand()**. Sometimes applying **tExpand()** to a result from **tCollect()**, or vice versa, in two separate steps simplifies an expression.

tExpand()

tExpand(*Expr1***)** ⇒ *expression*

Returns an expression in which sines and cosines of integer-multiple angles, angle sums, and angle differences are expanded. Because of the identity (sin(x))2+(cos(x))2=1, there are many possible equivalent results. Consequently, a result might differ from a result shown in other publications.

$\text{tExpand}(\sin(3\cdot\varphi))$	$4\cdot\sin(\varphi)\cdot(\cos(\varphi))^2-\sin(\varphi)$
$\text{tExpand}(\cos(\alpha-\beta))$	
	$\cos(\alpha)\cdot\cos(\beta)+\sin(\alpha)\cdot\sin(\beta)$

Sometimes **tExpand()** will accomplish your goals when the default trigonometric simplification does not. **tExpand()** tends to reverse transformations done by **tCollect()**. Sometimes applying **tCollect()** to a result from **tExpand()**, or vice versa, in two separate steps simplifies an expression.

Note: Degree-mode scaling by π/180 interferes with the ability of **tExpand()** to recognize expandable forms. For best results, **tExpand()** should be used in Radian mode.

Text*promptString*[**,** *DispFlag*]

Programming command: Pauses the program and displays the character string *promptString* in a dialog box.

When the user selects **OK**, program execution continues.

The optional *flag* argument can be any expression.

- If *DispFlag* is omitted or evaluates to **1**, the text message is added to the Calculator history.
- If *DispFlag* evaluates to **0**, the text message is not added to the history.

If the program needs a typed response from the user, refer to **Request**, page 149, or **RequestStr**, page 151.

Note: You can use this command within a user-defined program but not within a function.

Define a program that pauses to display each of five random numbers in a dialog box.

Within the Prgm…EndPrgm template, complete each line by pressing ↵ instead of enter. On the computer keyboard, hold down **Alt** and press **Enter**.

```
Define text_demo()=Prgm
  For i,1,5
    strinfo:="Random number " &
string(rand(i))
    Text strinfo
  EndFor
EndPrgm
```

Run the program:

```
text_demo()
```

Sample of one dialog box:

---

tInterval *List*[**,** *Freq*[**,** *CLevel*]]

(Data list input)

tInterval $\bar{x}$**,** *sx***,** *n***[,** *CLevel***]**

(Summary stats input)

Computes a *t* confidence interval. A summary of results is stored in the *stat.results* variable. (See page 176.)

For information on the effect of empty
elements in a list, see "Empty (Void)
Elements," page 251.

Output variable	Description
stat.CLower, stat.CUpper	Confidence interval for an unknown population mean
stat.$\bar{x}$	Sample mean of the data sequence from the normal random distribution
stat.ME	Margin of error
stat.df	Degrees of freedom
stat.σx	Sample standard deviation
stat.n	Length of the data sequence with sample mean

tInterval_2Samp   **Catalog >** 📖

tInterval_2Samp *List1*,*List2*[,*Freq1*[,*Freq2*
[,*CLevel*[,*Pooled*]]]]

(Data list input)

tInterval_2Samp $\bar{x}1$,*sx1*,*n1*,$\bar{x}2$,*sx2*,*n2*
[,*CLevel*[,*Pooled*]]

(Summary stats input)

Computes a two-sample *t* confidence
interval. A summary of results is stored in
the *stat.results* variable. (See page 176.)

Pooled=**1** pools variances; *Pooled*=**0** does
not pool variances.

For information on the effect of empty
elements in a list, see "Empty (Void)
Elements," page 251.

Output variable	Description
stat.CLower, stat.CUpper	Confidence interval containing confidence level probability of distribution
stat.$\bar{x}1$-$\bar{x}2$	Sample means of the data sequences from the normal random distribution
stat.ME	Margin of error
stat.df	Degrees of freedom

Output variable	Description
stat.$\bar{x}$1, stat.$\bar{x}$2	Sample means of the data sequences from the normal random distribution
stat.σx1, stat.σx2	Sample standard deviations for *List 1* and *List 2*
stat.n1, stat.n2	Number of samples in data sequences
stat.sp	The pooled standard deviation. Calculated when *Pooled* = YES

---

tmpCnv()   **Catalog >** 📖

tmpCnv(*Expr_°tempUnit***, _***°tempUnit2***)**
⇒ *expression _°tempUnit2*

Converts a temperature value specified by
Expr from one unit to another. Valid
temperature units are:

_°C Celsius
_°F Fahrenheit
_°K Kelvin
_°R Rankine

To type °, select it from the Catalog
symbols.

to type _ , press ctrl ⎵ .

For example, 100_°C converts to 212_°F.

To convert a temperature range, use
Δ**tmpCnv()** instead.

tmpCnv$(100\cdot\_°C,\_°F)$	$212.\cdot\_°F$
tmpCnv$(32\cdot\_°F,\_°C)$	$0.\cdot\_°C$
tmpCnv$(0\cdot\_°C,\_°K)$	$273.15\cdot\_°K$
tmpCnv$(0\cdot\_°F,\_°R)$	$459.67\cdot\_°R$

Note: You can use the Catalog to select
temperature units.

ΔtmpCnv()   **Catalog >** 📖

Δ**tmpCnv(***Expr_°tempUnit***, _***°tempUnit2***)**
⇒ *expression _°tempUnit2*

Note: You can insert this function from the
keyboard by typing **deltaTmpCnv(**...**)**.

Converts a temperature range (the
difference between two temperature
values) specified by *Expr* from one unit to
another. Valid temperature units are:

_°C Celsius
_°F Fahrenheit
_°K Kelvin
_°R Rankine

ΔtmpCnv$(100\cdot\_°C,\_°F)$	$180.\cdot\_°F$
ΔtmpCnv$(180\cdot\_°F,\_°C)$	$100.\cdot\_°C$
ΔtmpCnv$(100\cdot\_°C,\_°K)$	$100.\cdot\_°K$
ΔtmpCnv$(100\cdot\_°F,\_°R)$	$100.\cdot\_°R$
ΔtmpCnv$(1\cdot\_°C,\_°F)$	$1.8\cdot\_°F$

Note: You can use the Catalog to select
temperature units.

Δ**tmpCnv()**	**Catalog >** 📖

To enter °, select it from the Symbol Palette or type @**d**.

To type _ , press ⌃ ␣ .

1_°C and 1_°K have the same magnitude, as do 1_°F and 1_°R. However, 1_°C is 9/5 as large as 1_°F.

For example, a 100_°C range (from 0_°C to 100_°C) is equivalent to a 180_°F range.

To convert a particular temperature value instead of a range, use **tmpCnv()**.

tPdf()	**Catalog >** 📖

tPdf($XVal$**,**df**)** ⇒ *number* if $XVal$ is a number, *list* if $XVal$ is a list

Computes the probability density function (pdf) for the Student-t distribution at a specified x value with specified degrees of freedom df.

trace()	**Catalog >** 📖

trace($squareMatrix$**)** ⇒ *expression*

Returns the trace (sum of all the elements on the main diagonal) of $squareMatrix$.

$$\text{trace}\left(\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}\right) \qquad 15$$

$$\text{trace}\left(\begin{bmatrix} a & 0 \\ 1 & a \end{bmatrix}\right) \qquad 2 \cdot a$$

Try
> *block1*

Else
> *block2*

EndTry

Executes *block1* unless an error occurs. Program execution transfers to *block2* if an error occurs in *block1*. System variable *errCode* contains the error code to allow the program to perform error recovery. For a list of error codes, see "*Error codes and messages*," page 261.

block1 and *block2* can be either a single statement or a series of statements separated with the ":" character.

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

To see the commands **Try**, **ClrErr**, and **PassErr** in operation, enter the eigenvals() program shown at the right. Run the program by executing each of the following expressions.

$$eigenvals\left(\begin{bmatrix} -3 \\ -41 \\ 5 \end{bmatrix}, \begin{bmatrix} -1 & 2 & -3.1 \end{bmatrix}\right)$$

$$eigenvals\left(\begin{bmatrix} 1 & 2 & 3 \end{bmatrix}, \begin{bmatrix} 1 \\ 2 \end{bmatrix}\right)$$

Note: See also **ClrErr**, page 25, and **PassErr**, page 131.

Define *prog1*() = Prgm
> Try
>   z:=z+1
>   Disp "z incremented."
>   Else
>   Disp "Sorry, z undefined."
>   EndTry
>   EndPrgm

Done

---

z:=1:*prog1*()

       z incremented.

Done

DelVar z:*prog1*()

       Sorry, z undefined.

Done

Define eigenvals(a,b)=Prgm
© Program eigenvals(A,B) displays eigenvalues of A•B

Try
  Disp "A= ",a
  Disp "B= ",b
  Disp " "

  Disp "Eigenvalues of A•B are:",eigVl(a*b)

Else
  If errCode=230 Then
    Disp "Error: Product of A•B must be a square matrix"
    ClrErr
  Else
    PassErr
  EndIf
EndTry

EndPrgm

tTest $\mu0$,*List*[*,Freq*[*,Hypoth*]]

(Data list input)

tTest $\mu0$,$\overline{x}$,*sx*,*n*,[*Hypoth*]

(Summary stats input)

Performs a hypothesis test for a single unknown population mean μ when the population standard deviation σ is unknown. A summary of results is stored in the *stat.results* variable. (See page 176.)

Test H_0: $\mu = \mu0$, against one of the following:

For H_a: $\mu < \mu0$, set *Hypoth*<0
For H_a: $\mu \neq \mu0$ (default), set *Hypoth*=0
For H_a: $\mu > \mu0$, set *Hypoth*>0

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.t	$(\overline{x} - \mu0) / (\text{stdev} / \text{sqrt}(n))$
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.df	Degrees of freedom
stat.$\overline{x}$	Sample mean of the data sequence in *List*
stat.sx	Sample standard deviation of the data sequence
stat.n	Size of the sample

tTest_2Samp *List1*,*List2*[*,Freq1*[*,Freq2*
[*,Hypoth*[*,Pooled*]]]]

(Data list input)

tTest_2Samp $\overline{x}1$,*sx1*,*n1*,$\overline{x}2$,*sx2*,*n2*[*,Hypoth*
[*,Pooled*]]

(Summary stats input)

tTest_2Samp

Computes a two-sample *t* test. A summary of results is stored in the *stat.results* variable. (See page 176.)

Test H$_0$: μ1 = μ2, against one of the following:

For H$_a$: μ1< μ2, set *Hypoth*<0
For H$_a$: μ1≠ μ2 (default), set *Hypoth*=0
For H$_a$: μ1> μ2, set *Hypoth*>0

Pooled=**1** pools variances
Pooled=**0** does not pool variances

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.t	Standard normal value computed for the difference of means
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.df	Degrees of freedom for the t-statistic
stat.x̄1, stat.x̄2	Sample means of the data sequences in *List 1* and *List 2*
stat.sx1, stat.sx2	Sample standard deviations of the data sequences in *List 1* and *List 2*
stat.n1, stat.n2	Size of the samples
stat.sp	The pooled standard deviation. Calculated when *Pooled*=1.

tvmFV()

tvmFV(N**,**I**,**PV**,**Pmt**,**[PpY]**,**[CpY]**,**[$PmtAt$]**)**
⇒ *value*

$$\text{tvmFV}(120,5,0,^-500,12,12) \qquad 77641.1$$

Financial function that calculates the future value of money.

Note: Arguments used in the TVM functions are described in the table of TVM arguments, page 195. See also **amortTbl()**, page 8.

tvmI()

tvmI(N**,**PV**,**Pmt**,**FV**,**[PpY]**,**[CpY]**,**[$PmtAt$]**)**
⇒ *value*

$$\text{tvmI}(240,100000,^-1000,0,12,12) \qquad 10.5241$$

tvmI()	**Catalog >** 🔲🔲

Financial function that calculates the
interest rate per year.

Note: Arguments used in the TVM functions
are described in the table of TVM
arguments, page 195. See also **amortTbl()**,
page 8.

tvmN()	**Catalog >** 🔲🔲

tvmN(I**,**PV**,**Pmt**,**FV**,**$[PpY]$**,**$[CpY]$**,**$[PmtAt]$**)**
⇒ *value*

$\text{tvmN}(5,0,-500,77641,12,12)$ 120.

Financial function that calculates the
number of payment periods.

Note: Arguments used in the TVM functions
are described in the table of TVM
arguments, page 195. See also **amortTbl()**,
page 8.

tvmPmt()	**Catalog >** 🔲🔲

tvmPmt(N**,**I**,**PV**,**FV**,**$[PpY]$**,**$[CpY]$**,**$[PmtAt]$**)**
⇒ *value*

$\text{tvmPmt}(60,4,30000,0,12,12)$ -552.496

Financial function that calculates the
amount of each payment.

Note: Arguments used in the TVM functions
are described in the table of TVM
arguments, page 195. See also **amortTbl()**,
page 8.

tvmPV()	**Catalog >** 🔲🔲

tvmPV(N**,**I**,**Pmt**,**FV**,**$[PpY]$**,**$[CpY]$**,**$[PmtAt]$**)**
⇒ *value*

$\text{tvmPV}(48,4,-500,30000,12,12)$ -3426.7

Financial function that calculates the
present value.

Note: Arguments used in the TVM functions
are described in the table of TVM
arguments, page 195. See also **amortTbl()**,
page 8.

TVM argument*	Description	Data type
N	Number of payment periods	real number
I	Annual interest rate	real number
PV	Present value	real number
Pmt	Payment amount	real number
FV	Future value	real number
PpY	Payments per year, default=1	integer > 0
CpY	Compounding periods per year, default=1	integer > 0
PmtAt	Payment due at the end or beginning of each period, default=end	integer (0=end, 1=beginning)

* These time-value-of-money argument names are similar to the TVM variable names (such as **tvm.pv** and **tvm.pmt**) that are used by the *Calculator* application's finance solver. Financial functions, however, do not store their argument values or results to the TVM variables.

TwoVar   **Catalog >**

TwoVar *X*, *Y*[, [*Freq*][, *Category*, *Include*]]

Calculates the TwoVar statistics. A summary of results is stored in the *stat.results* variable. (See page 176.)

All the lists must have equal dimension except for *Include*.

X and *Y* are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding *X* and *Y* data point. The default value is 1. All elements must be integers ≥ 0.

Category is a list of numeric category codes for the corresponding *X* and *Y* data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

An empty (void) element in any of the lists *X*, *Freq*, or *Category* results in a void for the corresponding element of all those lists. An empty element in any of the lists *X1* through *X20* results in a void for the corresponding element of all those lists. For more information on empty elements, see page 251.

Output variable	Description
stat.$\bar{x}$	Mean of x values
stat.Σx	Sum of x values
stat.Σx2	Sum of x2 values
stat.sx	Sample standard deviation of x
stat.σx	Population standard deviation of x
stat.n	Number of data points
stat.$\bar{y}$	Mean of y values
stat.Σy	Sum of y values
stat.Σy^2	Sum of y2 values
stat.sy	Sample standard deviation of y
stat.σy	Population standard deviation of y
stat.Σxy	Sum of x•y values
stat.r	Correlation coefficient
stat.MinX	Minimum of x values
stat.Q_1X	1st Quartile of x
stat.MedianX	Median of x
stat.Q_3X	3rd Quartile of x
stat.MaxX	Maximum of x values
stat.MinY	Minimum of y values
stat.Q_1Y	1st Quartile of y
stat.MedY	Median of y
stat.Q_3Y	3rd Quartile of y

Output variable	Description
stat.MaxY	Maximum of y values
stat.$\Sigma(x-\bar{x})^2$	Sum of squares of deviations from the mean of x
stat.$\Sigma(y-\bar{y})^2$	Sum of squares of deviations from the mean of y

U

unitV()   Catalog > 📖

unitV($Vector1$**)** $\Rightarrow$ $vector$

Returns either a row- or column-unit vector, depending on the form of $Vector1$.

$Vector1$ must be either a single-row matrix or a single-column matrix.

$$\text{unitV}\left(\begin{bmatrix} a & b & c \end{bmatrix}\right)$$
$$\left[\frac{a}{\sqrt{a^2+b^2+c^2}} \quad \frac{b}{\sqrt{a^2+b^2+c^2}} \quad \frac{c}{\sqrt{a^2+b^2+c}}\right.$$
$$\text{unitV}\left(\begin{bmatrix} 1 & 2 & 1 \end{bmatrix}\right) \quad \left[\frac{\sqrt{6}}{6} \quad \frac{\sqrt{6}}{3} \quad \frac{\sqrt{6}}{6}\right]$$
$$\text{unitV}\left(\begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}\right) \quad \begin{bmatrix} \frac{\sqrt{14}}{14} \\ \frac{\sqrt{14}}{7} \\ \frac{3\cdot\sqrt{14}}{14} \end{bmatrix}$$

To see the entire result,
press ▲ and then use ◀ and ▶ to move the cursor.

unLock   Catalog > 📖

unLock $Var1$[, $Var2$] [, $Var3$] ...
unLock $Var.$

Unlocks the specified variables or variable group. Locked variables cannot be modified or deleted.

See **Lock**, page 106, and **getLockInfo()**, page 82.

a:=65	65
Lock a	Done
getLockInfo(a)	1
a:=75	"Error: Variable is locked."
DelVar a	"Error: Variable is locked."
Unlock a	Done
a:=75	75
DelVar a	Done

varPop()

varPop($List$[**,** $freqList$]**)** ⇒ *expression*

Returns the population variance of $List$.

Each $freqList$ element counts the number of consecutive occurrences of the corresponding element in $List$.

Note: $List$ must contain at least two elements.

If an element in either list is empty (void), that element is ignored, and the corresponding element in the other list is also ignored. For more information on empty elements, see page 251.

$\mathrm{varPop}(\{5,10,15,20,25,30\})$	$\dfrac{875}{12}$
$Ans \cdot 1.$	72.9167

varSamp()

varSamp($List$[**,** $freqList$]**)** ⇒ *expression*

Returns the sample variance of $List$.

Each $freqList$ element counts the number of consecutive occurrences of the corresponding element in $List$.

Note: $List$ must contain at least two elements.

If an element in either list is empty (void), that element is ignored, and the corresponding element in the other list is also ignored. For more information on empty elements, see page 251.

$\mathrm{varSamp}(\{a,b,c\})$	
	$\dfrac{a^2 - a \cdot (b+c) + b^2 - b \cdot c + c^2}{3}$
$\mathrm{varSamp}(\{1,2,5,\text{-}6,3,\text{-}2\})$	$\dfrac{31}{2}$
$\mathrm{varSamp}(\{1,3,5\},\{4,6,2\})$	$\dfrac{68}{33}$

varSamp($Matrix1$[**,** $freqMatrix$]**)** ⇒ *matrix*

Returns a row vector containing the sample variance of each column in $Matrix1$.

Each $freqMatrix$ element counts the number of consecutive occurrences of the corresponding element in $Matrix1$.

$$\mathrm{varSamp}\left(\begin{bmatrix} 1 & 2 & 5 \\ \text{-}3 & 0 & 1 \\ .5 & .7 & 3 \end{bmatrix}\right) \quad \begin{bmatrix} 4.75 & 1.03 & 4 \end{bmatrix}$$

$$\mathrm{varSamp}\left(\begin{bmatrix} \text{-}1.1 & 2.2 \\ 3.4 & 5.1 \\ \text{-}2.3 & 4.3 \end{bmatrix}, \begin{bmatrix} 6 & 3 \\ 2 & 4 \\ 5 & 1 \end{bmatrix}\right)$$
$$\begin{bmatrix} 3.91731 & 2.08411 \end{bmatrix}$$

varSamp() | Catalog > 📖

If an element in either matrix is empty (void), that element is ignored, and the corresponding element in the other matrix is also ignored. For more information on empty elements, see page 251.

Note: *Matrix1* must contain at least two rows.

W

Wait | Catalog > 📖

Wait *timeInSeconds*

Suspends execution for a period of *timeInSeconds* seconds.

Wait is particularly useful in a program that needs a brief delay to allow requested data to become available.

The argument *timeInSeconds* must be an expression that simplifies to a decimal value in the range 0 through 100. The command rounds this value up to the nearest 0.1 seconds.

To cancel a **Wait** that is in progress,

- **Handheld:** Hold down the 🏠on key and press enter repeatedly.
- **Windows®:** Hold down the **F12** key and press **Enter** repeatedly.
- **Macintosh®:** Hold down the **F5** key and press **Enter** repeatedly.
- **iPad®:** The app displays a prompt. You can continue waiting or cancel.

Note: You can use the **Wait** command within a user-defined program but not within a function.

To wait 4 seconds:

```
Wait 4
```

To wait 1/2 second:

```
Wait 0.5
```

To wait 1.3 seconds using the variable *seccount*:

```
seccount:=1.3
Wait seccount
```

This example switches a green LED on for 0.5 seconds and then switches it off.

```
Send "SET GREEN 1 ON"
Wait 0.5
Send "SET GREEN 1 OFF"
```

warnCodes ()

warnCodes(*Expr1***,** *StatusVar***)** ⇒
expression

Evaluates expression *Expr1*, returns the
result, and stores the codes of any
generated warnings in the *StatusVar* list
variable. If no warnings are generated, this
function assigns *StatusVar* an empty list.

Expr1 can be any valid TI-Nspire™ or
TI-Nspire™ CAS math expression. You
cannot use a command or assignment as
Expr1.

StatusVar must be a valid variable name.

For a list of warning codes and associated
messages, see page 269.

⚠ $\text{warnCodes}\left(\text{solve}\left(\sin(10 \cdot x) = \dfrac{x^2}{x}, x\right), warn\right)$

$x = -0.84232 \text{ or } x = -0.706817 \text{ or } x = -0.2852\blacktriangleright$

warn $\{10007, 10009\}$

To see the entire result,
press ▲ and then use ◄ and ► to move the
cursor.

when()

when(*Condition***,** *trueResult* [**,** *falseResult*]
[**,** *unknownResult*]**)** ⇒ *expression*

Returns *trueResult*, *falseResult*, or
unknownResult, depending on whether
Condition is true, false, or unknown.
Returns the input if there are too few
arguments to specify the appropriate result.

Omit both *falseResult* and *unknownResult*
to make an expression defined only in the
region where *Condition* is true.

$\text{when}(x<0, x+3)|x=5$ undef

Use an **undef** *falseResult* to define an
expression that graphs only on an interval.

when() is helpful for defining recursive
functions.

$\text{when}(n>0, n \cdot factoral(n-1), 1) \rightarrow factoral(n)$
Done

$factoral(3)$ 6

$3!$ 6

While	**Catalog >** 📖

While *Condition*
    Block
EndWhile

Executes the statements in *Block* as long as *Condition* is true.

Block can be either a single statement or a sequence of statements separated with the ":" character.

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

Define *sum_of_recip*(n)=Func
    Local *i*,*tempsum*
    $1 \rightarrow i$
    $0 \rightarrow tempsum$
    While $i \leq n$
        $tempsum + \dfrac{1}{i} \rightarrow tempsum$
        $i+1 \rightarrow i$
    EndWhile
    Return *tempsum*
  EndFunc

                   Done

sum_of_recip(3) $\dfrac{11}{6}$

X

xor	**Catalog >** 📖

BooleanExpr1 **xor** *BooleanExpr2* returns *Boolean expressionBooleanList1* **xor** *BooleanList2* returns *Boolean listBooleanMatrix1* **xor** *BooleanMatrix2* returns *Boolean matrix*

Returns true if *BooleanExpr1* is true and *BooleanExpr2* is false, or vice versa.

Returns false if both arguments are true or if both are false. Returns a simplified Boolean expression if either of the arguments cannot be resolved to true or false.

Note: See **or, page 129.**

true xor true	false
5>3 xor 3>5	true

Integer1 **xor** *Integer2*⟹ *integer*

Compares two real integers bit-by-bit using an **xor** operation. Internally, both integers are converted to signed, 64-bit binary numbers. When corresponding bits are compared, the result is 1 if either bit (but not both) is 1; the result is 0 if both bits are 0 or both bits are 1. The returned value represents the bit results, and is displayed according to the Base mode.

In Hex base mode:

Important: Zero, not the letter O.

0h7AC36 xor 0h3D5F	0h79169

In Bin base mode:

0b100101 xor 0b100	0b100001

You can enter the integers in any number base. For a binary or hexadecimal entry, you must use the 0b or 0h prefix, respectively. Without a prefix, integers are treated as decimal (base 10).

Note: A binary entry can have up to 64 digits (not counting the 0b prefix). A hexadecimal entry can have up to 16 digits.

If you enter a decimal integer that is too large for a signed, 64-bit binary form, a symmetric modulo operation is used to bring the value into the appropriate range. For more information, see ►**Base2**, page 17.

Note: See **or**, page 129.

Z

zeros(*Expr***,** *Var***)** $\Rightarrow$ *list*

zeros(*Expr***,** *Var=Guess***)** $\Rightarrow$ *list*

Returns a list of candidate real values of *Var* that make *Expr*=0. **zeros()** does this by computing **exp►list(solve(***Expr*=0,*Var***)***,Var***)**.

$$\text{zeros}\left(a \cdot x^2 + b \cdot x + c, x\right)$$

$$\left\{\frac{\sqrt{b^2 - 4 \cdot a \cdot c} - b}{2 \cdot a}, \frac{-\left(\sqrt{b^2 - 4 \cdot a \cdot c} + b\right)}{2 \cdot a}\right\}$$

$$a \cdot x^2 + b \cdot x + c | x = Ans[2] \qquad 0$$

For some purposes, the result form for **zeros()** is more convenient than that of **solve()**. However, the result form of **zeros()** cannot express implicit solutions, solutions that require inequalities, or solutions that do not involve *Var*.

Note: See also **cSolve()**, **cZeros()**, and **solve()**.

$$\text{exact}\left(\text{zeros}\left(a \cdot \left(e^x + x\right) \cdot \left(\text{sign}(x) - 1\right), x\right)\right) \quad \{[\;]\}$$

$$\text{exact}\left(\text{solve}\left(a \cdot \left(e^x + x\right) \cdot \left(\text{sign}(x) - 1\right) = 0, x\right)\right)$$

$$e^x + x = 0 \text{ or } x > 0 \text{ or } a = 0$$

zeros({*Expr1***,** *Expr2***},** {*VarOrGuess1***,** *VarOrGuess2* [**,** ...]**})** $\Rightarrow$ *matrix*

Returns candidate real zeros of the simultaneous algebraic expressions, where each *VarOrGuess* specifies an unknown whose value you seek.

Optionally, you can specify an initial guess for a variable. Each *VarOrGuess* must have the form:

variable

– or –

variable = real or non-real number

For example, x is valid and so is x=3.

If all of the expressions are polynomials and if you do NOT specify any initial guesses, **zeros()** uses the lexical Gröbner/Buchberger elimination method to attempt to determine all real zeros.

For example, suppose you have a circle of radius r at the origin and another circle of radius r centered where the first circle crosses the positive x-axis. Use **zeros()** to find the intersections.

As illustrated by r in the example to the right, simultaneous polynomial expressions can have extra variables that have no values, but represent given numeric values that could be substituted later.

Each row of the resulting matrix represents an alternate zero, with the components ordered the same as the *varOrGuess* list. To extract a row, index the matrix by [*row*].

$$\text{zeros}\left(\left\{x^2+y^2-r^2, (x-r)^2+y^2-r^2\right\}, \{x,y\}\right)$$

$$\begin{bmatrix} \dfrac{r}{2} & \dfrac{-\sqrt{3}\cdot r}{2} \\ \dfrac{r}{2} & \dfrac{\sqrt{3}\cdot r}{2} \end{bmatrix}$$

Extract row 2:

$$Ans[2] \qquad\qquad \begin{bmatrix} \dfrac{r}{2} & \dfrac{\sqrt{3}\cdot r}{2} \end{bmatrix}$$

You can also (or instead) include unknowns that do not appear in the expressions. For example, you can include z as an unknown to extend the previous example to two parallel intersecting cylinders of radius r. The cylinder zeros illustrate how families of zeros might contain arbitrary constants in the form ck, where k is an integer suffix from 1 through 255.

For polynomial systems, computation time or memory exhaustion may depend strongly on the order in which you list unknowns. If your initial choice exhausts memory or your patience, try rearranging the variables in the expressions and/or *varOrGuess* list.

$$\text{zeros}\left(\left\{x^2+y^2-r^2, (x-r)^2+y^2-r^2\right\}, \{x,y,z\}\right)$$

$$\begin{bmatrix} \dfrac{r}{2} & \dfrac{-\sqrt{3}\cdot r}{2} & c1 \\ \dfrac{r}{2} & \dfrac{\sqrt{3}\cdot r}{2} & c1 \end{bmatrix}$$

If you do not include any guesses and if any expression is non-polynomial in any variable but all expressions are linear in the unknowns, **zeros()** uses Gaussian elimination to attempt to determine all real zeros.

$$\text{zeros}\left(\left\{x+e^z\cdot y-1, x-y-\sin(z)\right\}, \{x,y\}\right)$$
$$\begin{bmatrix} \dfrac{e^z\cdot\sin(z)+1}{e^z+1} & \dfrac{-(\sin(z)-1)}{e^z+1} \end{bmatrix}$$

If a system is neither polynomial in all of its variables nor linear in its unknowns, **zeros()** determines at most one zero using an approximate iterative method. To do so, the number of unknowns must equal the number of expressions, and all other variables in the expressions must simplify to numbers.

$$\text{zeros}\left(\left\{e^z\cdot y-1, -y-\sin(z)\right\}, \{y,z\}\right)$$
$$\begin{bmatrix} 0.041458 & 3.18306 \\ 0.001871 & 6.28131 \\ 4.76\text{E}{-11} & 1796.99 \\ 2.\text{E}{-13} & 254.469 \end{bmatrix}$$

Each unknown starts at its guessed value if there is one; otherwise, it starts at 0.0.

Use guesses to seek additional zeros one by one. For convergence, a guess may have to be rather close to a zero.

$$\text{zeros}\left(\left\{e^z\cdot y-1, -y-\sin(z)\right\}, \{y, z=2\cdot\pi\}\right)$$
$$\begin{bmatrix} 0.001871 & 6.28131 \end{bmatrix}$$

zInterval σ,*List*[,*Freq*[,*CLevel*]]

(Data list input)

zInterval σ,$\overline{x}$,*n* [,*CLevel*]

(Summary stats input)

Computes a *z* confidence interval. A summary of results is stored in the *stat.results* variable. (See page 176.)

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.CLower, stat.CUpper	Confidence interval for an unknown population mean
stat.$\overline{x}$	Sample mean of the data sequence from the normal random distribution
stat.ME	Margin of error
stat.sx	Sample standard deviation

Output variable	Description
stat.n	Length of the data sequence with sample mean
stat.σ	Known population standard deviation for data sequence *List*

zInterval_1Prop

zInterval_1Prop *x***,***n* [**,***CLevel*]

Computes a one-proportion *z* confidence interval. A summary of results is stored in the *stat.results* variable. (See page 176.)

x is a non-negative integer.

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.CLower, stat.CUpper	Confidence interval containing confidence level probability of distribution
stat.$\hat{p}$	The calculated proportion of successes
stat.ME	Margin of error
stat.n	Number of samples in data sequence

zInterval_2Prop

zInterval_2Prop *x1***,***n1***,***x2***,***n2*[**,***CLevel*]

Computes a two-proportion *z* confidence interval. A summary of results is stored in the *stat.results* variable. (See page 176.)

x1 and *x2* are non-negative integers.

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.CLower, stat.CUpper	Confidence interval containing confidence level probability of distribution
stat.$\hat{p}$ Diff	The calculated difference between proportions
stat.ME	Margin of error

Output variable	Description
stat.$\hat{p}$1	First sample proportion estimate
stat.$\hat{p}$2	Second sample proportion estimate
stat.n1	Sample size in data sequence one
stat.n2	Sample size in data sequence two

zInterval_2Samp

zInterval_2Samp σ*₁*,σ*₂* ,*List1*,*List2*[,*Freq1*
[,*Freq2*,[*CLevel*]]]

(Data list input)

zInterval_2Samp σ*₁*,σ*₂*,$\overline{x}$*1*,*n1*,$\overline{x}$*2*,*n2*
[,*CLevel*]

(Summary stats input)

Computes a two-sample *z* confidence
interval. A summary of results is stored in
the *stat.results* variable. (See page 176.)

For information on the effect of empty
elements in a list, see "Empty (Void)
Elements," page 251.

Output variable	Description
stat.CLower, stat.CUpper	Confidence interval containing confidence level probability of distribution
stat.$\overline{x}$1-$\overline{x}$2	Sample means of the data sequences from the normal random distribution
stat.ME	Margin of error
stat.$\overline{x}$1, stat.$\overline{x}$2	Sample means of the data sequences from the normal random distribution
stat.σx1, stat.σx2	Sample standard deviations for *List 1* and *List 2*
stat.n1, stat.n2	Number of samples in data sequences
stat.r1, stat.r2	Known population standard deviations for data sequence *List 1* and *List 2*

zTest

zTest μ*0*,σ,*List*,[*Freq*[,*Hypoth*]]

(Data list input)

zTest $\mu0$**,**σ**,**$\overline{x}$**,**n[**,***Hypoth*]

(Summary stats input)

Performs a *z* test with frequency *freqlist*. A summary of results is stored in the *stat.results* variable. (See page 176.)

Test H$_0$: μ = μ0, against one of the following:

For H$_a$: μ < μ0, set *Hypoth*<0
For H$_a$: μ ≠ μ0 (default), set *Hypoth*=0
For H$_a$: μ > μ0, set *Hypoth*>0

For information on the effect of empty elements in a list, see "Empty (Void) Elements," page 251.

Output variable	Description
stat.z	$(\overline{x} - \mu0) / (\sigma / sqrt(n))$
stat.P Value	Least probability at which the null hypothesis can be rejected
stat.$\overline{x}$	Sample mean of the data sequence in *List*
stat.sx	Sample standard deviation of the data sequence. Only returned for *Data* input.
stat.n	Size of the sample

Output variable	Description
stat.p0	Hypothesized population proportion
stat.z	Standard normal value computed for the proportion
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.$\hat{p}$	Estimated sample proportion
stat.n	Size of the sample

zTest_2Prop *x1***,***n1***,***x2***,***n2*[**,***Hypoth*]

zTest_2Prop   Catalog > 📖

Computes a two-proportion z test. A
summary of results is stored in the
stat.results variable. (See page 176.)

$x1$ and $x2$ are non-negative integers.

Test H$_0$: $p1 = p2$, against one of the
following:

For H$_a$: $p1 > p2$, set *Hypoth*>0
For H$_a$: $p1 \neq p2$ (default), set *Hypoth*=0
For H$_a$: $p < p0$, set *Hypoth*<0

For information on the effect of empty
elements in a list, see "Empty (Void)
Elements," page 251.

Output variable	Description
stat.z	Standard normal value computed for the difference of proportions
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.$\hat{p}$1	First sample proportion estimate
stat.$\hat{p}$2	Second sample proportion estimate
stat.$\hat{p}$	Pooled sample proportion estimate
stat.n1, stat.n2	Number of samples taken in trials 1 and 2

zTest_2Samp   Catalog > 📖

zTest_2Samp σ_1,σ_2,*List1*,*List2*[,*Freq1*
[,*Freq2*[,*Hypoth*]]]

(Data list input)

zTest_2Samp σ_1,σ_2,$\bar{x}1$,*n1*,$\bar{x}2$,*n2*[,*Hypoth*]

(Summary stats input)

Computes a two-sample z test. A summary
of results is stored in the *stat.results*
variable. (See page 176.)

Test H$_0$: $\mu1 = \mu2$, against one of the
following:

For H$_a$: $\mu1 < \mu2$, set *Hypoth*<0
For H$_a$: $\mu1 \neq \mu2$ (default), set *Hypoth*=0
For H$_a$: $\mu1 > \mu2$, *Hypoth*>0

For information on the effect of empty
elements in a list, see "Empty (Void)
Elements," page 251.

Output variable	Description
stat.z	Standard normal value computed for the difference of means
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.$\overline{x}$1, stat.$\overline{x}$2	Sample means of the data sequences in *List1* and *List2*
stat.sx1, stat.sx2	Sample standard deviations of the data sequences in *List1* and *List2*
stat.n1, stat.n2	Size of the samples

Symbols

+ (add)

Expr1 + Expr2 ⇒ *expression*

Returns the sum of the two arguments.

56	56
56+4	60
60+4	64
64+4	68
68+4	72

List1 + List2 ⇒ *list*

Matrix1 + Matrix2 ⇒ *matrix*

Returns a list (or matrix) containing the sums of corresponding elements in *List1* and *List2* (or *Matrix1* and *Matrix2*).

Dimensions of the arguments must be equal.

$\left\{22, \pi, \dfrac{\pi}{2}\right\} \rightarrow l1$	$\left\{22, \pi, \dfrac{\pi}{2}\right\}$
$\left\{10, 5, \dfrac{\pi}{2}\right\} \rightarrow l2$	$\left\{10, 5, \dfrac{\pi}{2}\right\}$
$l1+l2$	$\{32, \pi+5, \pi\}$
$Ans+\{\pi, ^-5, ^-\pi\}$	$\{\pi+32, \pi, 0\}$
$\begin{bmatrix} a & b \\ c & d \end{bmatrix} + \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$	$\begin{bmatrix} a+1 & b \\ c & d+1 \end{bmatrix}$

Expr + List1 ⇒ *list*

List1 + Expr ⇒ *list*

Returns a list containing the sums of *Expr* and each element in *List1*.

$15+\{10,15,20\}$	$\{25,30,35\}$
$\{10,15,20\}+15$	$\{25,30,35\}$

Expr + Matrix1 ⇒ *matrix*

Matrix1 + Expr ⇒ *matrix*

Returns a matrix with *Expr* added to each element on the diagonal of *Matrix1*. *Matrix1* must be square.

$20+\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$	$\begin{bmatrix} 21 & 2 \\ 3 & 24 \end{bmatrix}$

Note: Use **.+** (dot plus) to add an expression to each element.

− (subtract)

Expr1 − Expr2 ⇒ *expression*

Returns *Expr1* minus *Expr2*.

$6-2$	4
$\pi-\dfrac{\pi}{6}$	$\dfrac{5\cdot\pi}{6}$

List1 −List2 ⇒ *list*

Matrix1 −Matrix2 ⇒ *matrix*

$\left\{22, \pi, \dfrac{\pi}{2}\right\} - \left\{10, 5, \dfrac{\pi}{2}\right\}$	$\{12, \pi-5, 0\}$
$\begin{bmatrix} 3 & 4 \end{bmatrix} - \begin{bmatrix} 1 & 2 \end{bmatrix}$	$\begin{bmatrix} 2 & 2 \end{bmatrix}$

− (subtract)   ⊟ key

Subtracts each element in *List2* (or
Matrix2) from the corresponding element
in *List1* (or *Matrix1*), and returns the
results.

Dimensions of the arguments must be
equal.

$Expr − List1 \Rightarrow list$

$List1 − Expr \Rightarrow list$

$15-\{10,15,20\}$	$\{5,0,\text{-}5\}$
$\{10,15,20\}-15$	$\{\text{-}5,0,5\}$

Subtracts each *List1* element from *Expr* or
subtracts *Expr* from each *List1* element,
and returns a list of the results.

$Expr − Matrix1 \Rightarrow matrix$

$Matrix1 − Expr \Rightarrow matrix$

$20-\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$	$\begin{bmatrix} 19 & \text{-}2 \\ \text{-}3 & 16 \end{bmatrix}$

Expr − Matrix1 returns a matrix of *Expr*
times the identity matrix minus
Matrix1. *Matrix1* must be square.

Matrix1 − Expr returns a matrix of *Expr*
times the identity matrix subtracted from
Matrix1. *Matrix1* must be square.

Note: Use .− (dot minus) to subtract an
expression from each element.

• (multiply)   ⊠ key

$Expr1 \bullet Expr2 \Rightarrow expression$

Returns the product of the two arguments.

$2 \cdot 3.45$	6.9
$x \cdot y \cdot x$	$x^2 \cdot y$

$List1 \bullet List2 \Rightarrow list$

Returns a list containing the products of the
corresponding elements in *List1* and *List2*.

Dimensions of the lists must be equal.

$\{1.,2,3\}\cdot\{4,5,6\}$	$\{4.,10,18\}$
$\left\{\dfrac{2}{a},\dfrac{3}{2}\right\}\cdot\left\{a^2,\dfrac{b}{3}\right\}$	$\left\{2\cdot a,\dfrac{b}{2}\right\}$

$Matrix1 \bullet Matrix2 \Rightarrow matrix$

Returns the matrix product of *Matrix1* and
Matrix2.

The number of columns in *Matrix1* must
equal the number of rows in *Matrix2*.

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}\cdot\begin{bmatrix} a & d \\ b & e \\ c & f \end{bmatrix}$$

$$\begin{bmatrix} a+2\cdot b+3\cdot c & d+2\cdot e+3\cdot f \\ 4\cdot a+5\cdot b+6\cdot c & 4\cdot d+5\cdot e+6\cdot f \end{bmatrix}$$

• (multiply)   × key

Expr •List1 ⇒ *list*

List1•Expr ⇒ *list*

Returns a list containing the products of
Expr and each element in *List1*.

$$\pi \cdot \{4,5,6\} \qquad \{4 \cdot \pi, 5 \cdot \pi, 6 \cdot \pi\}$$

Expr •Matrix1 ⇒ *matrix*

Matrix1•Expr ⇒ *matrix*

Returns a matrix containing the products of
Expr and each element in *Matrix1*.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \cdot 0.01 \qquad \begin{bmatrix} 0.01 & 0.02 \\ 0.03 & 0.04 \end{bmatrix}$$

$$\lambda \cdot \text{identity}(3) \qquad \begin{bmatrix} \lambda & 0 & 0 \\ 0 & \lambda & 0 \\ 0 & 0 & \lambda \end{bmatrix}$$

Note: Use **.•**(dot multiply) to multiply an
expression by each element.

∕(divide)   ÷ key

Expr1 ∕ Expr2 ⇒ *expression*

Returns the quotient of *Expr1* divided by
Expr2.

Note: See also **Fraction template**, page 1.

$$\frac{2}{3.45} \qquad .57971$$

$$\frac{x^3}{x} \qquad x^2$$

List1 ∕ List2 ⇒ *list*

Returns a list containing the quotients of
List1 divided by *List2*.

Dimensions of the lists must be equal.

$$\frac{\{1.,2,3\}}{\{4,5,6\}} \qquad \left\{0.25, \frac{2}{5}, \frac{1}{2}\right\}$$

Expr ∕ List1 ⇒ *list*

List1 ∕ Expr ⇒ *list*

Returns a list containing the quotients of
Expr divided by *List1* or*List1* divided by
Expr.

$$\frac{a}{\{3,a,\sqrt{a}\}} \qquad \left\{\frac{a}{3}, 1, \sqrt{a}\right\}$$

$$\frac{\{a,b,c\}}{a \cdot b \cdot c} \qquad \left\{\frac{1}{b \cdot c}, \frac{1}{a \cdot c}, \frac{1}{a \cdot b}\right\}$$

Matrix1 ∕ Expr ⇒ *matrix*

Returns a matrix containing the quotients
of *Matrix1 ∕ Expr*.

$$\frac{\begin{bmatrix} a & b & c \end{bmatrix}}{a \cdot b \cdot c} \qquad \begin{bmatrix} \dfrac{1}{b \cdot c} & \dfrac{1}{a \cdot c} & \dfrac{1}{a \cdot b} \end{bmatrix}$$

Matrix1 ∕ Value ⇒ *matrix*

/(divide)   ÷ key

Note: Use **./** (dot divide) to divide an expression by each element.

^ (power)   ^ key

Expr1 **^** *Expr2*⇒ *expression*

$$4^2 \qquad\qquad 16$$

List1 **^** *List2* ⇒ *list*

$$\{a,2,c\}^{\{1,b,3\}} \qquad \left\{a,2^b,c^3\right\}$$

Returns the first argument raised to the power of the second argument.

Note: See also **Exponent template**, page 1.

For a list, returns the elements in *List1* raised to the power of the corresponding elements in *List2*.

In the real domain, fractional powers that have reduced exponents with odd denominators use the real branch versus the principal branch for complex mode.

Expr **^** *List1* ⇒ *list*

$$p^{\{a,2,-3\}} \qquad \left\{p^a, p^2, \frac{1}{p^3}\right\}$$

Returns *Expr* raised to the power of the elements in *List1*.

List1 **^** *Expr* ⇒ *list*

$$\{1,2,3,4\}^{-2} \qquad \left\{1, \frac{1}{4}, \frac{1}{9}, \frac{1}{16}\right\}$$

Returns the elements in *List1* raised to the power of *Expr*.

squareMatrix1 **^** *integer* ⇒ *matrix*

Returns *squareMatrix1* raised to the *integer* power.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}^2 \qquad \begin{bmatrix} 7 & 10 \\ 15 & 22 \end{bmatrix}$$

squareMatrix1 must be a square matrix.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}^{-1} \qquad \begin{bmatrix} -2 & 1 \\ \frac{3}{2} & \frac{-1}{2} \end{bmatrix}$$

If *integer* = −1, computes the inverse matrix.
If *integer* < −1, computes the inverse matrix to an appropriate positive power.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}^{-2} \qquad \begin{bmatrix} \frac{11}{2} & \frac{-5}{2} \\ \frac{-15}{4} & \frac{7}{4} \end{bmatrix}$$

x² (square)

*Expr1*² ⇒ *expression*

Returns the square of the argument.

*List1*² ⇒ *list*

Returns a list containing the squares of the elements in *List1*.

*squareMatrix1*² ⇒ *matrix*

Returns the matrix square of *squareMatrix1*. This is not the same as calculating the square of each element. Use .^2 to calculate the square of each element.

$$4^2 \qquad\qquad 16$$

$$\{2,4,6\}^2 \qquad \{4,16,36\}$$

$$\begin{bmatrix} 2 & 4 & 6 \\ 3 & 5 & 7 \\ 4 & 6 & 8 \end{bmatrix}^2 \qquad \begin{bmatrix} 40 & 64 & 88 \\ 49 & 79 & 109 \\ 58 & 94 & 130 \end{bmatrix}$$

$$\begin{bmatrix} 2 & 4 & 6 \\ 3 & 5 & 7 \\ 4 & 6 & 8 \end{bmatrix} .^\wedge 2 \qquad \begin{bmatrix} 4 & 16 & 36 \\ 9 & 25 & 49 \\ 16 & 36 & 64 \end{bmatrix}$$

.+ (dot add)

Matrix1 .+ *Matrix2* ⇒ *matrix*

Expr .+ *Matrix1* ⇒ *matrix*

Matrix1.+*Matrix2* returns a matrix that is the sum of each pair of corresponding elements in *Matrix1* and *Matrix2*.

Expr .+ *Matrix1* returns a matrix that is the sum of *Expr* and each element in *Matrix1*.

$$\begin{bmatrix} a & 2 \\ b & 3 \end{bmatrix} .+ \begin{bmatrix} c & 4 \\ 5 & d \end{bmatrix} \qquad \begin{bmatrix} a+c & 6 \\ b+5 & d+3 \end{bmatrix}$$

$$x .+ \begin{bmatrix} c & 4 \\ 5 & d \end{bmatrix} \qquad \begin{bmatrix} x+c & x+4 \\ x+5 & x+d \end{bmatrix}$$

. ¯ (dot subt.)

Matrix1 .− *Matrix2* ⇒ *matrix*

Expr .− *Matrix1* ⇒ *matrix*

Matrix1.− *Matrix2* returns a matrix that is the difference between each pair of corresponding elements in *Matrix1* and *Matrix2*.

Expr .− *Matrix1* returns a matrix that is the difference of *Expr* and each element in *Matrix1*.

.

$$\begin{bmatrix} a & 2 \\ b & 3 \end{bmatrix} .- \begin{bmatrix} c & 4 \\ d & 5 \end{bmatrix} \qquad \begin{bmatrix} a-c & -2 \\ b-d & -2 \end{bmatrix}$$

$$x .- \begin{bmatrix} c & 4 \\ d & 5 \end{bmatrix} \qquad \begin{bmatrix} x-c & x-4 \\ x-d & x-5 \end{bmatrix}$$

.•(dot mult.) `.` `×` keys

Matrix1 .• *Matrix2* ⇒ *matrix*

Expr .• *Matrix1* ⇒ *matrix*

Matrix1.• *Matrix2* returns a matrix that is the product of each pair of corresponding elements in *Matrix1* and *Matrix2*.

Expr .• *Matrix1* returns a matrix containing the products of *Expr* and each element in *Matrix1*.

$$\begin{bmatrix} a & 2 \\ b & 3 \end{bmatrix} .\cdot \begin{bmatrix} c & 4 \\ 5 & d \end{bmatrix} \qquad \begin{bmatrix} a\cdot c & 8 \\ 5\cdot b & 3\cdot d \end{bmatrix}$$

$$x \cdot . \begin{bmatrix} a & b \\ c & d \end{bmatrix} \qquad \begin{bmatrix} a\cdot x & b\cdot x \\ c\cdot x & d\cdot x \end{bmatrix}$$

./(dot divide) `.` `÷` keys

Matrix1./ *Matrix2* ⇒ *matrix*

Expr ./ *Matrix1* ⇒ *matrix*

Matrix1 ./ *Matrix2* returns a matrix that is the quotient of each pair of corresponding elements in *Matrix1* and *Matrix2*.

Expr ./ *Matrix1* returns a matrix that is the quotient of *Expr* and each element in *Matrix1*.

$$\begin{bmatrix} a & 2 \\ b & 3 \end{bmatrix} ./ \left(\begin{bmatrix} c & 4 \\ 5 & d \end{bmatrix} \right) \qquad \begin{bmatrix} \dfrac{a}{c} & \dfrac{1}{2} \\ \dfrac{b}{5} & \dfrac{3}{d} \end{bmatrix}$$

$$x ./ \left(\begin{bmatrix} c & 4 \\ 5 & d \end{bmatrix} \right) \qquad \begin{bmatrix} \dfrac{x}{c} & \dfrac{x}{4} \\ \dfrac{x}{5} & \dfrac{x}{d} \end{bmatrix}$$

.^ (dot power) `.` `^` keys

Matrix1 .^ *Matrix2* ⇒ *matrix*

Expr .^ *Matrix1* ⇒ *matrix*

Matrix1.^ *Matrix2* returns a matrix where each element in *Matrix2* is the exponent for the corresponding element in *Matrix1*.

Expr .^ *Matrix1* returns a matrix where each element in *Matrix1* is the exponent for *Expr*.

$$\begin{bmatrix} a & 2 \\ b & 3 \end{bmatrix} .^{\wedge} \begin{bmatrix} c & 4 \\ 5 & d \end{bmatrix} \qquad \begin{bmatrix} a^c & 16 \\ b^5 & 3^d \end{bmatrix}$$

$$x .^{\wedge} \begin{bmatrix} c & 4 \\ 5 & d \end{bmatrix} \qquad \begin{bmatrix} x^c & x^4 \\ x^5 & x^d \end{bmatrix}$$

− (negate) `(−)` key

−*Expr1* ⇒ *expression*

−*List1* ⇒ *list*

−*Matrix1* ⇒ *matrix*

-2.43	-2.43
-{ -1,0.4,1.2ᴇ19 }	{ 1,-0.4,-1.2ᴇ19 }
-a· -b	a· b

− (negate)   [(−)] **key**

Returns the negation of the argument.

For a list or matrix, returns all the elements negated.

If the argument is a binary or hexadecimal integer, the negation gives the two's complement.

In Bin base mode:

Important: Zero, not the letter O.

```
-0b100101
0b1111111111111111111111111111111111111▶
```

To see the entire result,
press ▲ and then use ◄ and ► to move the cursor.

% (percent)   [ctrl] [⌨] **keys**

$Expr1\% \Rightarrow expression$

$List1\% \Rightarrow list$

$Matrix1\% \Rightarrow matrix$

Returns $\dfrac{argument}{100}$

For a list or matrix, returns a list or matrix with each element divided by 100.

Note: To force an approximate result,

Handheld: Press [ctrl] [enter].
Windows®: Press **Ctrl+Enter**.
Macintosh®: Press ⌘+**Enter**.
iPad®: Hold **enter**, and select $\approx$.

13%	0.13

$(\{1,10,100\})\%$	$\{0.01, 0.1, 1.\}$

= (equal)   [=] **key**

$Expr1=Expr2 \Rightarrow Boolean\ expression$

$List1=List2 \Rightarrow Boolean\ list$

$Matrix1=Matrix2 \Rightarrow Boolean\ matrix$

Returns true if $Expr1$ is determined to be equal to $Expr2$.

Returns false if $Expr1$ is determined to not be equal to $Expr2$.

Anything else returns a simplified form of the equation.

For lists and matrices, returns comparisons element by element.

Example function that uses math test symbols: =, ≠, <, ≤, >, ≥

Define $g(x)$=Func
    If $x≤-5$ Then
      Return 5
    ElseIf $x>-5$ and $x<0$ Then
      Return $-x$
    ElseIf $x≥0$ and $x≠10$ Then
      Return x
    ElseIf $x=10$ Then
      Return 3
    EndIf
    EndFunc
                  Done

= (equal) $\boxed{=}$ **key**

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

Result of graphing g(x)

≠ (not equal) $\boxed{\text{ctrl}}$ $\boxed{=}$ **keys**

Expr1≠Expr2 ⇒ Boolean expression

List1≠List2 ⇒ Boolean list

Matrix1≠Matrix2 ⇒ Boolean matrix

Returns true if *Expr1* is determined to be not equal to *Expr2*.

Returns false if *Expr1* is determined to be equal to *Expr2*.

Anything else returns a simplified form of the equation.

For lists and matrices, returns comparisons element by element.

Note: You can insert this operator from the keyboard by typing **/=**

See "=" (equal) example.

< (less than) $\boxed{\text{ctrl}}$ $\boxed{=}$ **keys**

Expr1<Expr2 ⇒ Boolean expression

List1<List2 ⇒ Boolean list

Matrix1<Matrix2 ⇒ Boolean matrix

Returns true if *Expr1* is determined to be less than *Expr2*.

See "=" (equal) example.

< (less than)

Returns false if *Expr1* is determined to be greater than or equal to *Expr2*.

Anything else returns a simplified form of the equation.

For lists and matrices, returns comparisons element by element.

≤ (less or equal)

Expr1≤Expr2 ⇒ *Boolean expression*

List1≤List2 ⇒ *Boolean list*

Matrix1 ≤Matrix2 ⇒ *Boolean matrix*

Returns true if *Expr1* is determined to be less than or equal to *Expr2*.

Returns false if *Expr1* is determined to be greater than *Expr2*.

Anything else returns a simplified form of the equation.

For lists and matrices, returns comparisons element by element.

Note: You can insert this operator from the keyboard by typing **<=**

See "=" (equal) example.

> (greater than)

Expr1>Expr2 ⇒ *Boolean expression*

List1>List2 ⇒ *Boolean list*

Matrix1>Matrix2 ⇒ *Boolean matrix*

Returns true if *Expr1* is determined to be greater than *Expr2*.

Returns false if *Expr1* is determined to be less than or equal to *Expr2*.

Anything else returns a simplified form of the equation.

See "=" (equal) example.

> (greater than)

For lists and matrices, returns comparisons element by element.

≥ (greater or equal)

Expr1≥Expr2 ⇒ Boolean expression

See "=" (equal) example.

List1≥List2 ⇒ Boolean list

Matrix1 ≥Matrix2 ⇒ Boolean matrix

Returns true if *Expr1* is determined to be greater than or equal to *Expr2*.

Returns false if *Expr1* is determined to be less than *Expr2*.

Anything else returns a simplified form of the equation.

For lists and matrices, returns comparisons element by element.

Note: You can insert this operator from the keyboard by typing **>=**

⇒ (logical implication)

BooleanExpr1 ⇒ BooleanExpr2 returns *Boolean expression*

BooleanList1 ⇒ BooleanList2 returns *Boolean list*

BooleanMatrix1 ⇒ BooleanMatrix2 returns *Boolean matrix*

Integer1 ⇒ Integer2 returns *Integer*

Evaluates the expression **not** <argument1> **or** <argument2> and returns true, false, or a simplified form of the equation.

For lists and matrices, returns comparisons element by element.

Note: You can insert this operator from the keyboard by typing **=>**

5>3 or 3>5	true
5>3 ⇒ 3>5	false
3 or 4	7
3 ⇒ 4	-4
{1,2,3} or {3,2,1}	{3,2,3}
{1,2,3} ⇒ {3,2,1}	{-1,-1,-3}

⇔ (logical double implication, XNOR) `ctrl` `=` keys

BooleanExpr1 ⇔ *BooleanExpr2* returns *Boolean expression*

BooleanList1 ⇔ *BooleanList2* returns *Boolean list*

BooleanMatrix1 ⇔ *BooleanMatrix2* returns *Boolean matrix*

Integer1 ⇔ *Integer2* returns *Integer*

Returns the negation of an **XOR** Boolean operation on the two arguments. Returns true, false, or a simplified form of the equation.

For lists and matrices, returns comparisons element by element.

Note: You can insert this operator from the keyboard by typing **<=>**

5>3 xor 3>5	true
5>3 ⇔ 3>5	false
3 xor 4	7
3 ⇔ 4	-8
$\{1,2,3\}$ xor $\{3,2,1\}$	$\{2,0,2\}$
$\{1,2,3\}$ ⇔ $\{3,2,1\}$	$\{-3,-1,-3\}$

! (factorial) `?!▸` key

*Expr1***!** $\Rightarrow$ *expression*

*List1***!** $\Rightarrow$ *list*

*Matrix1***!** $\Rightarrow$ *matrix*

Returns the factorial of the argument.

For a list or matrix, returns a list or matrix of factorials of the elements.

5!	120
$(\{5,4,3\})!$	$\{120,24,6\}$
$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}!$	$\begin{bmatrix} 1 & 2 \\ 6 & 24 \end{bmatrix}$

& (append) `ctrl` `⌨` keys

String1 **&** *String2* $\Rightarrow$ *string*

Returns a text string that is *String2* appended to *String1*.

"Hello "&"Nick"	"Hello Nick"

d() (derivative)

d(*Expr1*, *Var*[, *Order*]) ⇒ *expression*

d(*List1*, *Var*[, *Order*]) ⇒ *list*

d(*Matrix1*,*Var*[, *Order*]) ⇒ *matrix*

Returns the first derivative of the first argument with respect to variable *Var*.

Order, if included, must be an integer. If the order is less than zero, the result will be an anti-derivative.

Note: You can insert this function from the keyboard by typing **derivative(**...**)**.

d() does not follow the normal evaluation mechanism of fully simplifying its arguments and then applying the function definition to these fully simplified arguments. Instead, *d*() performs the following steps:

1. Simplify the second argument only to the extent that it does not lead to a non-variable.

2. Simplify the first argument only to the extent that it does recall any stored value for the variable determined by step 1.

3. Determine the symbolic derivative of the result of step 2 with respect to the variable from step 1.

If the variable from step 1 has a stored value or a value specified by the constraint ("|") operator, substitute that value into the result from step 3.

Note: See also **First derivative**, page 5; **Second derivative**, page 6; or **Nth derivative**, page 6.

$\dfrac{d}{dx}(f(x) \cdot g(x))$	$\dfrac{d}{dx}(f(x)) \cdot g(x) + \dfrac{d}{dx}(g(x)) \cdot f(x)$
$\dfrac{d}{dy}\left(\dfrac{d}{dx}\left(x^2 \cdot y^3\right)\right)$	$6 \cdot y^2 \cdot x$
$\dfrac{d}{dx}\left(\left\{x^2, x^3, x^4\right\}\right)$	$\left\{2 \cdot x, 3 \cdot x^2, 4 \cdot x^3\right\}$

∫() (integral)

∫(*Expr1*, *Var*[,*Lower*,*Upper*]) ⇒ *expression*

∫(*Expr1*,*Var*[,*Constant*]) ⇒ *expression*

$\displaystyle\int_a^b x^2\,dx$	$\dfrac{b^3}{3} - \dfrac{a^3}{3}$

∫() (integral)   Catalog > 📖

Returns the integral of *Expr1* with respect
to the variable *Var* from *Lower* to *Upper*.

Note: See also **Definite** or **Indefinite integral
template**, page 6.

Note: You can insert this function from the
keyboard by typing `integral(...)`.

If *Lower* and *Upper* are omitted, returns an
anti-derivative. A symbolic constant of
integration is omitted unless you provide
the *Constant* argument.

$$\int x^2 \, dx \qquad\qquad \frac{x^3}{3}$$

$$\int (a \cdot x^2, x, c) \qquad\qquad \frac{a \cdot x^3}{3} + c$$

Equally valid anti-derivatives might differ by
a numeric constant. Such a constant might
be disguised—particularly when an anti-
derivative contains logarithms or inverse
trigonometric functions. Moreover,
piecewise constant expressions are
sometimes added to make an anti-
derivative valid over a larger interval than
the usual formula.

∫() returns itself for pieces of *Expr1* that it
cannot determine as an explicit finite
combination of its built-in functions and
operators.

$$\int \left(b \cdot e^{-x^2} + \frac{a}{x^2 + a^2} \right) dx \quad b \cdot \int e^{-x^2}\, dx + \tan^{-1}\!\left(\frac{x}{a} \right)$$

When you provide *Lower* and *Upper*, an
attempt is made to locate any
discontinuities or discontinuous derivatives
in the interval *Lower* < *Var* < *Upper* and to
subdivide the interval at those places.

For the Auto setting of the **Auto or
Approximate** mode, numerical integration is
used where applicable when an anti-
derivative or a limit cannot be determined.

For the Approximate setting, numerical
integration is tried first, if applicable. Anti-
derivatives are sought only where such
numerical integration is inapplicable or
fails.

Note: To force an approximate result,

Handheld: Press ⌈ctrl⌉ ⌈enter⌉.
Windows®: Press **Ctrl+Enter**.
Macintosh®: Press ⌘+**Enter**.
iPad®: Hold **enter**, and select ≈ .

∫() (integral)

$$\int_{-1}^{1} e^{-x^2}\, dx \qquad 1.49365$$

∫() can be nested to do multiple integrals. Integration limits can depend on integration variables outside them.

Note: See also **nInt()**, page 122.

$$\int_{0}^{a}\int_{0}^{x} \ln(x+y)\, dy\, dx$$

$$\frac{a^2 \cdot \ln(a)}{2} + \frac{a^2 \cdot \left(4 \cdot \ln(2) - 3\right)}{4}$$

√() (square root)

$\sqrt{(Expr1)} \Rightarrow expression$

$\sqrt{(List1)} \Rightarrow list$

$$\sqrt{4} \qquad 2$$

$$\sqrt{\{9,a,4\}} \qquad \left\{3,\sqrt{a},2\right\}$$

Returns the square root of the argument.

For a list, returns the square roots of all the elements in *List1*.

Note: You can insert this function from the keyboard by typing `sqrt(...)`

Note: See also **Square root template**, page 1.

Π() (prodSeq)

$\Pi(Expr1, Var, Low, High) \Rightarrow expression$

Note: You can insert this function from the keyboard by typing `prodSeq(...)`.

Evaluates *Expr1* for each value of *Var* from *Low* to *High*, and returns the product of the results.

Note: See also **Product template (Π)**, page 5.

$$\prod_{n=1}^{5}\left(\frac{1}{n}\right) \qquad \frac{1}{120}$$

$$\prod_{k=1}^{n}\left(k^2\right) \qquad (n!)^2$$

$$\prod_{n=1}^{5}\left(\left\{\frac{1}{n},n,2\right\}\right) \qquad \left\{\frac{1}{120},120,32\right\}$$

Π() (prodSeq)   Catalog > 📖

Π(*Expr1*, *Var*, *Low*, *Low*−1) ⇒ 1

$$\prod_{k=4}^{3} (k) \qquad 1$$

Π(*Expr1*, *Var*, *Low*, *High*) ⇒ **1/**Π(*Expr1*, *Var*, *High+1*, *Low*−*1*) if *High* < *Low*−*1*

The product formulas used are derived from the following reference:

$$\prod_{k=4}^{1} \left(\frac{1}{k}\right) \qquad 6$$

Ronald L. Graham, Donald E. Knuth, and Oren Patashnik. *Concrete Mathematics: A Foundation for Computer Science*. Reading, Massachusetts: Addison-Wesley, 1994.

$$\prod_{k=4}^{1} \left(\frac{1}{k}\right) \cdot \prod_{k=2}^{4} \left(\frac{1}{k}\right) \qquad \frac{1}{4}$$

Σ() (sumSeq)   Catalog > 📖

Σ(*Expr1*, *Var*, *Low*, *High*) ⇒ *expression*

$$\sum_{n=1}^{5} \left(\frac{1}{n}\right) \qquad \frac{137}{60}$$

Note: You can insert this function from the keyboard by typing `sumSeq(...)`.

Evaluates *Expr1* for each value of *Var* from *Low* to *High*, and returns the sum of the results.

$$\sum_{k=1}^{n} (k^2) \qquad \frac{n \cdot (n+1) \cdot (2 \cdot n + 1)}{6}$$

Note: See also **Sum template**, page 5.

$$\sum_{n=1}^{\infty} \left(\frac{1}{n^2}\right) \qquad \frac{\pi^2}{6}$$

Σ(*Expr1*, *Var*, *Low*, *Low*−*1*) ⇒ 0

$$\sum_{k=4}^{3} (k) \qquad 0$$

Σ(*Expr1*, *Var*, *Low*, *High*) ⇒ μ

Σ(*Expr1*, *Var*, *High+1*, *Low*−1) if *High* < *Low*−*1*

$$\sum_{k=4}^{1} (k) \qquad -5$$

The summation formulas used are derived from the following reference:

Ronald L. Graham, Donald E. Knuth, and Oren Patashnik. *Concrete Mathematics: A Foundation for Computer Science*. Reading, Massachusetts: Addison-Wesley, 1994.

$$\sum_{k=4}^{1} (k) + \sum_{k=2}^{4} (k) \qquad 4$$

Σ**Int(**$NPmt1$**,** $NPmt2$**,** N**,** I**,** PV **,**[Pmt]**,** [FV]**,**
[PpY]**,** [CpY]**,** [$PmtAt$]**,** [$roundValue$]**)**
$\Rightarrow$ *value*

Σ**Int(**$NPmt1$**,**$NPmt2$**,**$amortTable$**)** $\Rightarrow$ *value*

Amortization function that calculates the
sum of the interest during a specified range
of payments.

NPmt1 and *NPmt2* define the start and end
boundaries of the payment range.

*N***,** *I***,** *PV***,** *Pmt***,** *FV***,** *PpY***,** *CpY***,** and *PmtAt*
are described in the table of TVM
arguments, page 195.

- If you omit *Pmt*, it defaults to
  Pmt=**tvmPmt**
  (*N***,***I***,***PV***,***FV***,***PpY***,***CpY***,***PmtAt***)**.
- If you omit *FV*, it defaults to *FV*=0.
- The defaults for *PpY*, *CpY*, and *PmtAt*
  are the same as for the TVM functions.

roundValue specifies the number of
decimal places for rounding. Default=2.

Σ**Int(**$NPmt1$**,**$NPmt2$**,**$amortTable$**)** calculates
the sum of the interest based on
amortization table *amortTable*. The
amortTable argument must be a matrix in
the form described under **amortTbl()**, page
8.

Note: See also ΣPrn(), below, and **Bal()**,
page 17.

(indirection)   ctrl 🔲 keys

*varNameString*

Refers to the variable whose name is *varNameString*. This lets you use strings to create variable names from within a function.

$\#(\text{"x"}\&\text{"y"}\&\text{"z"})$ *xyz*

Creates or refers to the variable xyz .

$10 \rightarrow r$	10
$\text{"r"} \rightarrow s1$	"r"
$\#s1$	10

Returns the value of the variable (r) whose name is stored in variable s1.

E (scientific notation)

*mantissa***E***exponent*

Enters a number in scientific notation. The number is interpreted as
mantissa × 10^*exponent*.

Hint: If you want to enter a power of 10 without causing a decimal value result, use
10^*integer*.

Note: You can insert this operator from the computer keyboard by typing @**E**. for example, type **2.3@E4** to enter 2.3**E**4.

23000.	23000.
2300000000.+4.1ε15	4.1ε15
$3 \cdot 10^4$	30000

g (gradian)

Expr1^g ⇒ *expression*

List1^g ⇒ *list*

Matrix1^g ⇒ *matrix*

In Degree, Gradian or Radian mode:

$\cos\left(50^g\right)$	$\dfrac{\sqrt{2}}{2}$
$\cos\left(\left\{0, 100^g, 200^g\right\}\right)$	$\left\{1, 0, \text{-}1\right\}$

This function gives you a way to specify a gradian angle while in the Degree or Radian mode.

In Radian angle mode, multiplies *Expr1* by π/200.

In Degree angle mode, multiplies *Expr1* by g/100.

In Gradian mode, returns *Expr1* unchanged.

Note: You can insert this symbol from the computer keyboard by typing @**g**.

r (radian)

Expr1^r ⇒ *expression*

List1^r ⇒ *list*

Matrix1^r ⇒ *matrix*

In Degree, Gradian or Radian angle mode:

$\cos\left(\dfrac{\pi}{4}^r\right)$	$\dfrac{\sqrt{2}}{2}$
$\cos\left(\left\{0^r, \dfrac{\pi}{12}^r, \text{-}(\pi)^r\right\}\right)$	$\left\{1, \dfrac{\left(\sqrt{3}+1\right)\cdot\sqrt{2}}{4}, \text{-}1\right\}$

' (radian)　　　　　　　　　　　　　　　　　　　　　　　　　π▸ key

This function gives you a way to specify a
radian angle while in Degree or Gradian
mode.

In Degree angle mode, multiplies the
argument by 180/π.

In Radian angle mode, returns the
argument unchanged.

In Gradian mode, multiplies the argument
by 200/π.

Hint: Use **'** if you want to force radians in a
function definition regardless of the mode
that prevails when the function is used.

Note: You can insert this symbol from the
computer keyboard by typing @**r**.

° (degree)　　　　　　　　　　　　　　　　　　　　　　　　　π▸ key

Expr1° ⇒ *expression*

List1° ⇒ *list*

Matrix1° ⇒ *matrix*

This function gives you a way to specify a
degree angle while in Gradian or Radian
mode.

In Radian angle mode, multiplies the
argument by π/180.

In Degree angle mode, returns the
argument unchanged.

In Gradian angle mode, multiplies the
argument by 10/9.

Note: You can insert this symbol from the
computer keyboard by typing @**d**.

In Degree, Gradian or Radian angle mode:

$$\cos(45°) \qquad \frac{\sqrt{2}}{2}$$

In Radian angle mode:

Note: To force an approximate result,

Handheld: Press ctrl enter.
Windows®: Press **Ctrl+Enter**.
Macintosh®: Press ⌘+**Enter**.
iPad®: Hold **enter**, and select ≈ .

$$\cos\left(\left\{0, \frac{\pi}{4}, 90°, 30.12°\right\}\right)$$
$$\{1., 0.707107, 0., 0.864976\}$$

°, ', " (degree/minute/second)　　　　　　　　　　　　　ctrl ⌨ keys

dd°mm'ss.ss" ⇒ *expression*

In Degree angle mode:

°, ', " (degree/minute/second)

dd A positive or negative number
mm A non-negative number
ss.ss A non-negative number

Returns *dd*+(*mm*/60)+(*ss.ss*/3600).

This base-60 entry format lets you:

* Enter an angle in degrees/minutes/seconds without regard to the current angle mode.
* Enter time as hours/minutes/seconds.

Note: Follow ss.ss with two apostrophes (''), not a quote symbol (").

25°13'17.5"	25.2215
25°30'	$\frac{51}{2}$

∠ (angle)

[*Radius*,∠ θ_*Angle*] ⇒ *vector*
(polar input)

[*Radius*,∠ θ_*Angle*,*Z_Coordinate*] ⇒ *vector*
(cylindrical input)

[*Radius*,∠ θ_*Angle*,∠ θ_*Angle*] ⇒ *vector*
(spherical input)

Returns coordinates as a vector depending on the Vector Format mode setting: rectangular, cylindrical, or spherical.

Note: You can insert this symbol from the computer keyboard by typing @<.

In Radian mode and vector format set to:
rectangular

$$\begin{bmatrix} 5 & \angle 60° & \angle 45° \end{bmatrix} \quad \begin{bmatrix} \frac{5 \cdot \sqrt{2}}{4} & \frac{5 \cdot \sqrt{6}}{4} & \frac{5 \cdot \sqrt{2}}{2} \end{bmatrix}$$

cylindrical

$$\begin{bmatrix} 5 & \angle 60° & \angle 45° \end{bmatrix} \quad \begin{bmatrix} \frac{5 \cdot \sqrt{2}}{2} & \angle \frac{\pi}{3} & \frac{5 \cdot \sqrt{2}}{2} \end{bmatrix}$$

spherical

$$\begin{bmatrix} 5 & \angle 60° & \angle 45° \end{bmatrix} \quad \begin{bmatrix} 5 & \angle \frac{\pi}{3} & \angle \frac{\pi}{4} \end{bmatrix}$$

(*Magnitude* ∠ *Angle*) ⇒ *complexValue*
(polar input)

Enters a complex value in (r ∠ θ) polar form. The *Angle* is interpreted according to the current Angle mode setting.

In Radian angle mode and Rectangular complex format:

$$5+3 \cdot i - \left(10 \ \angle -\frac{\pi}{4}\right) \qquad 5-5 \cdot \sqrt{2} + \left(3-5 \cdot \sqrt{2}\right) \cdot i$$

Note: To force an approximate result,

Handheld: Press ctrl enter.
Windows®: Press **Ctrl+Enter**.
Macintosh®: Press ⌘+**Enter**.
iPad®: Hold **enter**, and select ≈ .

∠ (angle) ⌨ ctrl 📖 keys

$$5+3\cdot i - \left(10 \angle \frac{\pi}{4}\right) \qquad -2.07107-4.07107\cdot i$$

' (prime) ?!▸ key

variable '
variable ' '

Enters a prime symbol in a differential
equation. A single prime symbol denotes a
1st-order differential equation, two prime
symbols denote a 2nd-order, and so on.

$$\text{deSolve}\left(y''=y^{\frac{-1}{2}} \text{ and } y(0)=0 \text{ and } y'(0)=0,t,y\right)$$
$$\frac{2\cdot y^{\frac{3}{4}}}{3}=t$$

_ (underscore as an empty element) See "Empty (Void) Elements," page 251.

_ (underscore as unit designator) ctrl ␣ keys

Expr_Unit

Designates the units for an *Expr*. All unit
names must begin with an underscore.

You can use pre-defined units or create your
own units. For a list of pre-defined units,
open the Catalog and display the Unit
Conversions tab. You can select unit names
from the Catalog or type the unit names
directly.

$$3\cdot \_m \blacktriangleright \_ft \qquad 9.84252\cdot \_ft$$

Note: You can find the conversion symbol,

▸, in the Catalog. Click $\boxed{\int \Sigma}$, and then click
Math Operators.

*Variable_*

When *Variable* has no value, it is treated
as though it represents a complex number.
By default, without the _ , the variable is
treated as real.

If *Variable* has a value, the _ is ignored and
Variable retains its original data type.

Note: You can store a complex number to a
variable without
using _ . However, for best results in
calculations such as **cSolve()** and **cZeros()**,
the _ is recommended.

Assuming z is undefined:

real(z)	z
real(z_)	real(z_)
imag(z)	0
imag(z_)	imag(z_)

► (convert)

Expr_Unit1► *_Unit2* ⇒ *Expr_Unit2*

$3 \cdot \_m \blacktriangleright \_ft$ $9.84252 \cdot \_ft$

Converts an expression from one unit to another.

The _ underscore character designates the units. The units must be in the same category, such as Length or Area.

For a list of pre-defined units, open the Catalog and display the Unit Conversions tab:

- You can select a unit name from the list.
- You can select the conversion operator, ►, from the top of the list.

You can also type unit names manually. To type "_" when typing unit names on the handheld, press ⌨ ⌴.

Note: To convert temperature units, use **tmpCnv()** and **∆tmpCnv()**. The ► conversion operator does not handle temperature units.

10^() Catalog >

10^ (*Expr1***)** ⇒ *expression*

$10^{1.5}$ 31.6228

10^ (*List1***)** ⇒ *list*

$10^{\{0,-2,2,a\}}$ $\left\{1, \dfrac{1}{100}, 100, 10^{a}\right\}$

Returns 10 raised to the power of the argument.

For a list, returns 10 raised to the power of the elements in *List1*.

10^(*squareMatrix1***)** ⇒ *squareMatrix*

Returns 10 raised to the power of *squareMatrix1*. This is not the same as calculating 10 raised to the power of each element. For information about the calculation method, refer to **cos()**.

$10^{\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}}$

$\begin{bmatrix} 1.14336\text{E}7 & 8.17155\text{E}6 & 6.67589\text{E}6 \\ 9.95651\text{E}6 & 7.11587\text{E}6 & 5.81342\text{E}6 \\ 7.65298\text{E}6 & 5.46952\text{E}6 & 4.46845\text{E}6 \end{bmatrix}$

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

^⁻¹ (reciprocal)

Expr1 **^⁻¹** ⇒ *expression*

List1 **^⁻¹** ⇒ *list*

Returns the reciprocal of the argument.

For a list, returns the reciprocals of the elements in *List1*.

$$(3.1)^{-1} \qquad 0.322581$$

$$\{a,4,-0.1,x,-2\}^{-1} \qquad \left\{\frac{1}{a},\frac{1}{4},-10.,\frac{1}{x},\frac{-1}{2}\right\}$$

squareMatrix1 **^⁻¹** ⇒ *squareMatrix*

Returns the inverse of *squareMatrix1*.

squareMatrix1 must be a non-singular square matrix.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}^{-1} \qquad \begin{bmatrix} -2 & 1 \\ \frac{3}{2} & \frac{-1}{2} \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 \\ a & 4 \end{bmatrix}^{-1} \qquad \begin{bmatrix} \frac{-2}{a-2} & \frac{1}{a-2} \\ \frac{a}{2\cdot(a-2)} & \frac{-1}{2\cdot(a-2)} \end{bmatrix}$$

| (constraint operator)

Expr **|** *BooleanExpr1*[**and** *BooleanExpr2*]...

Expr **|** *BooleanExpr1*[**or***BooleanExpr2*]...

The constraint ("|") symbol serves as a binary operator. The operand to the left of | is an expression. The operand to the right of | specifies one or more relations that are intended to affect the simplification of the expression. Multiple relations after | must be joined by logical "**and**" or "**or**" operators.

$$x+1|x=3 \qquad 4$$

$$x+y|x=\sin(y) \qquad \sin(y)+y$$

$$x+y|\sin(y)=x \qquad x+y$$

The constraint operator provides three basic types of functionality:

• Substitutions
• Interval constraints
• Exclusions

Substitutions are in the form of an equality, such as x=3 or y=sin(x). To be most effective, the left side should be a simple variable. *Expr* **|** *Variable* = *value* will substitute *value* for every occurrence of *Variable* in *Expr*.

$$x^3-2\cdot x+7 \to f(x) \qquad Done$$

$$f(x)|x=\sqrt{3} \qquad \sqrt{3}+7$$

$$(\sin(x))^2+2\cdot\sin(x)-6|\sin(x)=d \qquad d^2+2\cdot d-6$$
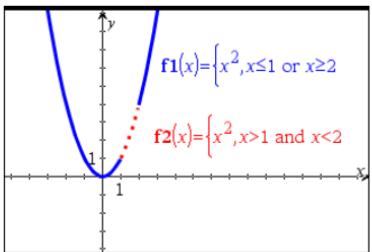

| (constraint operator)

Interval constraints take the form of one or more inequalities joined by logical "**and**" or "**or**" operators. Interval constraints also permit simplification that otherwise might be invalid or not computable.

$\text{solve}\left(x^2-1=0,x\right)\big|x>0 \text{ and } x<2$ $\quad x=1$

$\sqrt{x}\cdot\sqrt{\dfrac{1}{x}}\big|x>0$ $\qquad\qquad\qquad 1$

$\sqrt{x}\cdot\sqrt{\dfrac{1}{x}}$ $\qquad\qquad \sqrt{\dfrac{1}{x}}\cdot\sqrt{x}$

$\text{f1}(x)=\left\{x^2, x\le 1 \text{ or } x\ge 2\right.$

$\text{f2}(x)=\left\{x^2, x>1 \text{ and } x<2\right.$

Exclusions use the "not equals" (/= or ≠) relational operator to exclude a specific value from consideration. They are used primarily to exclude an exact solution when using **cSolve()**, **cZeros()**, **fMax()**, **fMin()**, **solve()**, **zeros()**, and so on.

$\text{solve}\left(x^2-1=0,x\right)\big|x\ne 1$ $\quad x=-1$

→ (store)

Expr → *Var*

List → *Var*

Matrix → *Var*

Expr → *Function*(*Param1*,...)

List → *Function*(*Param1*,...)

Matrix → *Function*(*Param1*,...)

If the variable *Var* does not exist, creates it and initializes it to *Expr*, *List*, or *Matrix*.

If the variable *Var* already exists and is not locked or protected, replaces its contents with *Expr*, *List*, or *Matrix*.

$\dfrac{\pi}{4}\to myvar$ $\qquad\qquad\qquad \dfrac{\pi}{4}$

$2\cdot\cos(x)\to y1(x)$ $\qquad\qquad Done$

$\{1,2,3,4\}\to lst5$ $\qquad\qquad \{1,2,3,4\}$

$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}\to matg$ $\qquad \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$

$\text{"Hello"}\to str1$ $\qquad\qquad \text{"Hello"}$

Hint: If you plan to do symbolic computations using undefined variables, avoid storing anything into commonly used, one-letter variables such as a, b, c, x, y, z, and so on.

Note: You can insert this operator from the keyboard by typing **=:** as a shortcut. For example, type `pi/4 =: myvar`.

:= (assign)

`ctrl` `ˠˡ{ˠ` **keys**

Var := *Expr*

Var := *List*

Var := *Matrix*

Function(*Param1*,...) := *Expr*

Function(*Param1*,...) := *List*

Function(*Param1*,...) := *Matrix*

If variable *Var* does not exist, creates *Var* and initializes it to *Expr*, *List*, or *Matrix*.

If *Var* already exists and is not locked or protected, replaces its contents with *Expr*, *List*, or *Matrix*.

Hint: If you plan to do symbolic computations using undefined variables, avoid storing anything into commonly used, one-letter variables such as a, b, c, x, y, z, and so on.

$myvar:=\dfrac{\pi}{4}$	$\dfrac{\pi}{4}$
$y1(x):=2\cdot\cos(x)$	*Done*
$lst5:=\{1,2,3,4\}$	$\{1,2,3,4\}$
$matg:=\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$	$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$
$str1:="Hello"$	$"Hello"$

© (comment)

© [*text*]

© processes *text* as a comment line, allowing you to annotate functions and programs that you create.

© can be at the beginning or anywhere in the line. Everything to the right of **©**, to the end of the line, is the comment.

Note for entering the example: For instructions on entering multi-line program and function definitions, refer to the Calculator section of your product guidebook.

Define $g(n)$=Func
   © *Declare variables*
   Local *i*,*result*
   result:=0
   For *i*,1,*n*,1 ©Loop *n times*
   result:=*result*+i^2
   EndFor

   EndFunc

<div align="right">

Done

</div>

$g(3)$ 14

0b, 0h

0b *binaryNumber*
0h *hexadecimalNumber*

Denotes a binary or hexadecimal number, respectively. To enter a binary or hex number, you must enter the 0b or 0h prefix regardless of the Base mode. Without a prefix, a number is treated as decimal (base 10).

Results are displayed according to the Base mode.

In Dec base mode:

0b10+0hF+10   27

In Bin base mode:

0b10+0hF+10   0b11011

In Hex base mode:

0b10+0hF+10   0h1B

TI-Nspire™ CX II - Draw Commands

This is a supplemental document for the TI-Nspire™ Reference Guide and the TI-Nspire™ CAS Reference Guide. All TI-Nspire™ CX II commands will be incorporated and published in version 5.1 of the TI-Nspire™ Reference Guide and the TI-Nspire™ CAS Reference Guide.

Graphics Programming

New commands have been added on TI-Nspire™ CX II Handhelds and TI-Nspire™ desktop applications for graphics programming.

The TI-Nspire™ CX II Handhelds will switch into this graphics mode while executing graphics commands and switch back to the context in which the program was executed after completion of the program.

The screen will display "Running…" in the top bar while the program is being executed. It will show "Finished" when the program completes. Any key-press will transition the system out of the graphics mode.

- The transition to graphics mode is triggered automatically when one of the Draw (graphics) commands is encountered during execution of the TI Basic program.

- This transition will only happen when executing a program from calculator; in a document or calculator in scratchpad.

- The transition out of graphics mode happens upon termination of the program.

- The graphics mode is only available on the TI-Nspire™ CX II Handhelds and the desktop TI-Nspire™ CX II Handhelds view. This means it is not available in the computer document view or PublishView (.tnsp) on the desktop nor on iOS.

    - If a graphics command is encountered while executing a TI Basic program from the incorrect context, an error message is displayed and the TI Basic program is terminated.

Graphics Screen

The graphics screen will contain a header at the top of the screen that cannot be written to by graphics commands.

The graphics screen drawing area will be cleared (color = 255,255,255) when the graphics screen is initialized.
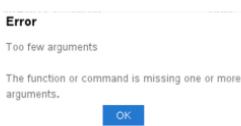

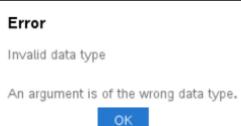

Graphics Screen	Default
Height	212
Width	318
Color	white: 255,255,255

Default View and Settings

- The status icons in the top bar (battery status, press-to-test status, network indicator etc.) will not be visible while a graphics program is running.

- Default drawing color: Black (0,0,0)

- Default pen style - normal, smooth

    - Thickness: 1 (thin), 2 (normal), 3 (thickest)

    - Style: 1 (smooth), 2 (dotted), 3 (dashed)

- All drawing commands will use the current color and pen settings; either default values or those which were set via TI-Basic commands.

- Text font is fixed and cannot be changed.

- Any output to the graphics screen will be drawn within a clipping window which is the size of the graphics screen drawing area. Any drawn output that extends outside of this clipped graphics screen drawing area will not be drawn. No error message will be displayed.

- All x,y coordinates specified for drawing commands are defined such that 0,0 is at the top left corner of the graphics screen drawing area.

    - **Exceptions:**

        - **DrawText** uses the coordinates as the bottom left corner of the bounding box for the text.

        - **SetWindow** uses the bottom left corner of the screen

- All parameters for the commands can be provided as expressions that evaluate to a number which is then rounded to the nearest integer.

Graphics Screen Errors Messages

If the validation fails, an error message will display.

Error Message	Description	View
Error Syntax	If the syntax checker finds any syntax errors, it displays an error message and tries to position the cursor near the first error so you can correct it.	
Error Too few arguments	The function or command is missing one or more arguments	
Error Too many arguments	The function or command contains and excessive number of arguments and cannot be evaluated.	
Error Invalid data type	An argument is of the wrong data type.	

Invalid Commands While in Graphics Mode

Some commands are not allowed once the program switches to graphics mode. If these commands are encountered while in graphics mode and error will be displayed and the program will be terminated.

Disallowed Command	Error Message
Request	Request cannot be executed in graphics mode
RequestStr	RequestStr cannot be executed in graphics mode
Text	Text cannot be executed in graphics mode

The commands that print text to the calculator - **disp** and **dispAt** - will be supported commands in the graphics context. The text from these commands will be sent to the Calculator screen (not on Graphics) and will be visible after the program exits and the system switches back to the Calculator app

C

Clear	Catalog > 📖 CXII

Clear *x, y, width, height*

Clears entire screen if no parameters are specified.

If *x, y, width* and *height* are specified, the rectangle defined by the parameters will be cleared.

```
Clear
```

Clears entire screen

```
Clear 10,10,100,50
```

Clears a rectangle area with top left corner on (10, 10) and with width 100, height 50

DrawArc	Catalog > 📖
	CXII

DrawArc *x, y, width, height, startAngle, arcAngle*

Draw an arc within the defined bounding rectangle with the provided start and arc angles.
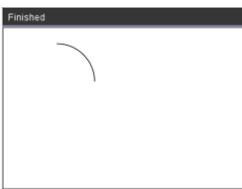

x, y: upper left coordinate of bounding rectangle

width, height: dimensions of bounding rectangle

The "arc angle" defines the sweep of the arc.

These parameters can be provided as expressions that evaluate to a number which is then rounded to the nearest integer.

```
DrawArc 20,20,100,100,0,90
```

```
DrawArc 50,50,100,100,0,180
```

See Also: FillArc
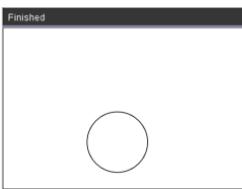

DrawCircle	Catalog > 📖
	CXII

DrawCircle *x, y, radius*

x, y: coordinate of center

radius: radius of the circle

```
DrawCircle 150,150,40
```

See Also: FillCircle

DrawLine
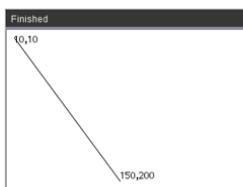

DrawLine *x1, y1, x2, y2*

Draw a line from *x1, y1, x2, y2*.

Expressions that evaluate to a number which is then rounded to the nearest integer.

Screen bounds: If the specified coordinates causes any part of the line to be drawn outside of the graphics screen, that part of the line will be clipped and no error message will be displayed.

DrawLine 10,10,150,200

DrawPoly

The commands have two variants:

DrawPoly *xlist, ylist*

or

DrawPoly *x1, y1, x2, y2, x3, y3...xn, yn*

Note: DrawPoly *xlist, ylist*
Shape will connect *x1, y1* to *x2, y2, x2, y2* to *x3, y3* and so on.

Note: DrawPoly *x1, y1, x2, y2, x3, y3...xn, yn*
xn, yn will **NOT** be automatically connected to *x1, y1*.

Expressions that evaluate to a list of real floats
xlist, ylist
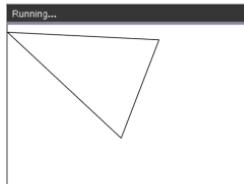

Expressions that evaluate to a single real float
x1, y1...xn, yn = coordinates for vertices of polygon
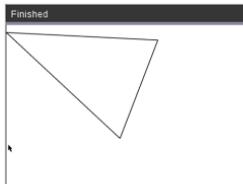

xlist:={0,200,150,0}

ylist:={10,20,150,10}

DrawPoly xlist,ylist

DrawPoly 0,10,200,20,150,150,0,10

DrawPoly	

Note: DrawPoly: Input size dimensions (width/height) relative to drawn lines. The lines are drawn in a bounding box around the specified coordinate and dimensions such that the actual size of the drawn polygon will be larger than the width and height.

See Also: FillPoly

DrawRect	

DrawRect *x, y, width, height*
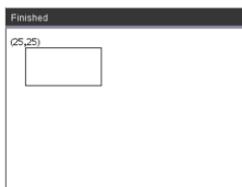

x, y: upper left coordinate of rectangle

width, *height*: width and height of rectangle (rectangle drawn down and right from starting coordinate).

Note: The lines are drawn in a bounding box around the specified coordinate and dimensions such that the actual size of the drawn rectangle will be larger than the width and height indicate.

See Also: FillRect

```
DrawRect 25,25,100,50
```

DrawText	

DrawText *x, y, exprOrString1 [,exprOrString2]...*

x, *y*: coordinate of text output

Draws the text in *exprOrString* at the specified *x*, *y* coordinate location.

The rules for *exprOrString* are the same as for **Disp – DrawText** can take multiple arguments.

```
DrawText 50,50,"Hello World"
```

F
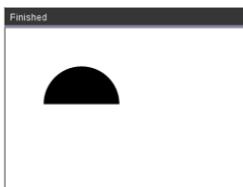

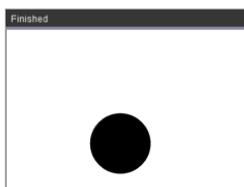

FillArc

FillArc *x, y, width, height startAngle, arcAngle*

x, y: upper left coordinate of bounding rectangle

Draw and fill an arc within the defined bounding rectangle with the provided start and arc angles.

Default fill color is black. The fill color can be set by the [SetColor](#) command

The "arc angle" defines the sweep of the arc

```
FillArc 50,50,100,100,0,180
```

FillCircle

FillCircle *x, y, radius*

x, y: coordinate of center
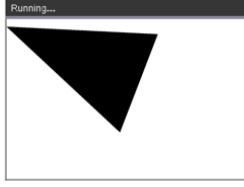

Draw and fill a circle at the specified center with the specified radius.

Default fill color is black. The fill color can be set by the [SetColor](#) command.

```
FillCircle 150,150,40
```

Here!

FillPoly

FillPoly *xlist, ylist*

or

FillPoly *x1, y1, x2, y2, x3, y3...xn, yn*
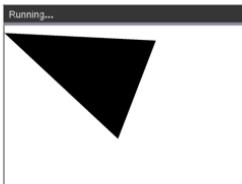

Note: The line and color are specified by [SetColor](#) and [SetPen](#)

```
xlist:={0,200,150,0}
ylist:={10,20,150,10}
FillPoly xlist,ylist
```

FillPoly 0,10,200,20,150,150,0,10

FillRect *x, y, width, height*

x, y: upper left coordinate of rectangle

width, *height*: width and height of rectangle

Draw and fill a rectangle with the top left corner at the coordinate specified by (*x,y*)

Default fill color is black. The fill color can be set by the SetColor command

Note: The line and color are specified by SetColor and SetPen

FillRect 25,25,100,50

G

getPlatform()	Catalog > 📖 CXII

getPlatform()

getPlatform()   "dt"

Returns:
"dt" on desktop software applications
"hh" on TI-Nspire™ CX handhelds
"ios" on TI-Nspire™ CX iPad® app

PaintBuffer	**Catalog >** 📖 **CXII**

PaintBuffer

Paint graphics buffer to screen

This command is used in conjunction with UseBuffer to increase the speed of display on the screen when the program generates multiple graphical objects.

```
UseBuffer
For n,1,10
x:=randInt(0,300)
y:=randInt(0,200)
radius:=randInt(10,50)
Wait 0.5
DrawCircle x,y,radius
EndFor
PaintBuffer
```

This program will display all the 10 circles at once.

If the "UseBuffer" command is removed, each circle will be displayed as it is drawn.

See Also: UseBuffer

PlotXY

PlotXY *x, y, shape*

x, y: coordinate to plot shape

shape : a number between 1 and 13 specifying the shape

1 - Filled circle

2 - Empty circle

3 - Filled square

4 - Empty square

5 - Cross

6 - Plus

7 - Thin

8 - medium point, solid

9 - medium point, empty

10 - larger point, solid

11 - larger point, empty

12 - largest point, solid

13 - largest point, empty

```
PlotXY 100,100,1
```

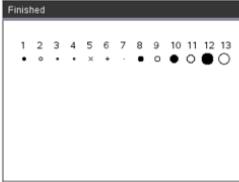

```
For n,1,13
DrawText 1+22*n,40,n
PlotXY 5+22*n,50,n
EndFor
```

SetColor	Catalog > 📖
	CXII

SetColor
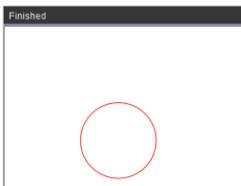

Red-value, Green-value, Blue-value

Valid values for red, green and blue are between 0 and 255

Sets the color for subsequent Draw commands

```
SetColor 255,0,0

DrawCircle 150,150,100
```

SetPen	Catalog > 📖
	CXII

SetPen

thickness, style

thickness: 1 <= thickness <= 3|1 is thinnest, 3 is thickest

style: 1 = Smooth, 2 = Dotted, 3 = Dashed

Sets the pen style for subsequent Draw commands

```
SetPen 3,3

DrawCircle 150,150,50
```

SetWindow	Catalog > 📖
	CXII

SetWindow

xMin, xMax, yMin, yMax

Establishes a logical window that maps to the graphics drawing area. All parameters are required.

If the part of drawn object is outside the window, the output will be clipped (not shown) and no error message is displayed.

```
SetWindow 0,160,0,120
```

will set the output window to have 0,0 in the bottom left corner with a width of 160 and a height of 120

```
DrawLine 0,0,100,100

SetWindow 0,160,0,120

SetPen 3,3

DrawLine 0,0,100,100
```
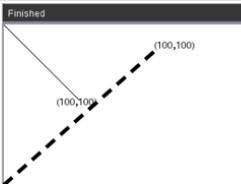

If xmin is greater than or equal to xmax or ymin is greater than or equal to ymax, an error message is shown.

Any objects drawn before a SetWindow command will not be re-drawn in the new configuration.

To reset the window parameters to the default, use:

SetWindow 0,0,0,0

UseBuffer

UseBuffer

Draw to an off screen graphics buffer instead of screen (to increase performance)

This command is used in conjunction with PaintBuffer to increase the speed of display on the screen when the program generates multiple graphical objects.

With UseBuffer, all the graphics are displayed only after the next PaintBuffer command is executed.

UseBuffer only needs to be called once in the program i.e. every use of PaintBuffer does not need a corresponding UseBuffer

See Also: PaintBuffer

```
UseBuffer
For n,1,10
x:=randInt(0,300)
y:=randInt(0,200)
radius:=randInt(10,50)
Wait 0.5
DrawCircle x,y,radius
EndFor
PaintBuffer
```

This program will display all the 10 circles at once.

If the "UseBuffer" command is removed, each circle will be displayed as it is drawn.

Empty (Void) Elements

When analyzing real-world data, you might not always have a complete data set. TI-Nspire™ CAS Software allows empty, or void, data elements so you can proceed with the nearly complete data rather than having to start over or discard the incomplete cases.

You can find an example of data involving empty elements in the Lists & Spreadsheet chapter, under "*Graphing spreadsheet data.*"

The **delVoid()** function lets you remove empty elements from a list. The **isVoid()** function lets you test for an empty element. For details, see **delVoid()**, page 49, and **isVoid()**, page 94.

Note: To enter an empty element manually in a math expression, type "_" or the keyword **void**. The keyword **void** is automatically converted to a "_" symbol when the expression is evaluated. To type "_" on the handheld, press ⌨ `ctrl` ⌨ `⎵` .

Calculations involving void elements

The majority of calculations involving a void input will produce a void result. See special cases below.

$\lfloor\_\rfloor$	$\_$
$\gcd\left(100,\_\right)$	$\_$
$3+\_$	$\_$
$\left\{5,\_,10\right\}-\left\{3,6,9\right\}$	$\left\{2,\_,1\right\}$

List arguments containing void elements

The following functions and commands ignore (skip) void elements found in list arguments.

count, **countIf**, **cumulativeSum**, **freqTable►list**, **frequency**, **max**, **mean**, **median**, **product**, **stDevPop**, **stDevSamp**, **sum**, **sumIf**, **varPop**, and **varSamp**, as well as regression calculations, **OneVar**, **TwoVar**, and **FiveNumSummary** statistics, confidence intervals, and stat tests

$\text{sum}\left(\left\{2,\_,3,5,6.6\right\}\right)$	16.6
$\text{median}\left(\left\{1,2,\_,\_,\_,3\right\}\right)$	2
$\text{cumulativeSum}\left(\left\{1,2,\_,4,5\right\}\right)$	$\left\{1,3,\_,7,12\right\}$
$\text{cumulativeSum}\left(\begin{bmatrix}1 & 2\\3 & \_\\5 & 6\end{bmatrix}\right)$	$\begin{bmatrix}1 & 2\\4 & \_\\9 & 8\end{bmatrix}$

SortA and **SortD** move all void elements within the first argument to the bottom.

$\left\{5,4,3,\_,1\right\}\rightarrow list1$	$\left\{5,4,3,\_,1\right\}$
$\left\{5,4,3,2,1\right\}\rightarrow list2$	$\left\{5,4,3,2,1\right\}$
SortA *list1,list2*	*Done*
list1	$\left\{1,3,4,5,\_\right\}$
list2	$\left\{1,3,4,5,2\right\}$

List arguments containing void elements

$\{1,2,3,\_,5\} \rightarrow list1$	$\{1,2,3,\_,5\}$
$\{1,2,3,4,5\} \rightarrow list2$	$\{1,2,3,4,5\}$
SortD *list1*,*list2*	*Done*
list1	$\{5,3,2,1,\_\}$
list2	$\{5,3,2,1,4\}$

In regressions, a void in an X or Y list introduces a void for the corresponding element of the residual.

$l1:=\{1,2,3,4,5\}$: $l2:=\{2,\_,3,5,6.6\}$	
	$\{2,\_,3,5,6.6\}$
LinRegMx *l1*,*l2*	*Done*
stat.Resid	
	$\{0.434286,\_,\text{-}0.862857,\text{-}0.011429,0.44\}$
stat.XReg	$\{1.,\_,3.,4.,5.\}$
stat.YReg	$\{2.,\_,3.,5.,6.6\}$
stat.FreqReg	$\{1.,\_,1.,1.,1.\}$

An omitted category in regressions introduces a void for the corresponding element of the residual.

$l1:=\{1,3,4,5\}$: $l2:=\{2,3,5,6.6\}$	$\{2,3,5,6.6\}$
$cat:=\{"M","M","F","F"\}$: $incl:=\{"F"\}$	
	$\{"F"\}$
LinRegMx *l1*,*l2*,1,*cat*,*incl*	*Done*
stat.Resid	$\{\_,\_,0.,0.\}$
stat.XReg	$\{\_,\_,4.,5.\}$
stat.YReg	$\{\_,\_,5.,6.6\}$
stat.FreqReg	$\{\_,\_,1.,1.\}$

A frequency of 0 in regressions introduces a void for the corresponding element of the residual.

$l1:=\{1,3,4,5\}$: $l2:=\{2,3,5,6.6\}$	$\{2,3,5,6.6\}$
LinRegMx *l1*,*l2*,$\{1,0,1,1\}$	*Done*
stat.Resid	$\{0.069231,\_,\text{-}0.276923,0.207692\}$
stat.XReg	$\{1.,\_,4.,5.\}$
stat.YReg	$\{2.,\_,5.,6.6\}$
stat.FreqReg	$\{1.,\_,1.,1.\}$

Shortcuts for Entering Math Expressions

Shortcuts let you enter elements of math expressions by typing instead of using the Catalog or Symbol Palette. For example, to enter the expression √6, you can type **sqrt (6)** on the entry line. When you press ⏎enter, the expression **sqrt(6)** is changed to √6. Some shortcuts are useful from both the handheld and the computer keyboard. Others are useful primarily from the computer keyboard.

From the Handheld or Computer Keyboard

To enter this:	Type this shortcut:
π	**pi**
θ	**theta**
∞	**infinity**
≤	**<=**
≥	**>=**
≠	**/=**
⇒ (logical implication)	**=>**
⇔ (logical double implication, XNOR)	**<=>**
→ (store operator)	**=:**
| | (absolute value)	**abs(…)**
√()	**sqrt(…)**
d()	**derivative(…)**
∫()	**integral(…)**
Σ() (Sum template)	**sumSeq(…)**
Π() (Product template)	**prodSeq(…)**
$\sin^{-1}()$, $\cos^{-1}()$, ...	**arcsin(…),arccos(…),...**
Δ**List()**	**deltaList(…)**
Δ**tmpCnv()**	**deltaTmpCnv(…)**

From the Computer Keyboard

To enter this:	Type this shortcut:
c1, *c2*, ... (constants)	**@c1, @c2, ...**

To enter this:	Type this shortcut:
n1, *n2*, ... (integer constants)	`@n1`, `@n2`, ...
i (imaginary constant)	`@i`
e (natural log base e)	`@e`
ᴱ (scientific notation)	`@E`
ᵀ (transpose)	`@t`
ʳ (radians)	`@r`
° (degrees)	`@d`
ᵍ (gradians)	`@g`
∠ (angle)	`@<`
► (conversion)	`@>`
►**Decimal**, ►**approxFraction()**, and so on.	`@>Decimal`, `@>approxFraction()`, and so on.

EOS™ (Equation Operating System) Hierarchy

This section describes the Equation Operating System (EOS™) that is used by the TI-Nspire™ CAS math and science learning technology. Numbers, variables, and functions are entered in a simple, straightforward sequence. EOS™ software evaluates expressions and equations using parenthetical grouping and according to the priorities described below.

Order of Evaluation

Level	Operator
1	Parentheses ( ), brackets [ ], braces { }
2	Indirection (#)
3	Function calls
4	Post operators: degrees-minutes-seconds ($°,',"$), factorial (!), percentage (%), radian (^{r}), subscript ([ ]), transpose (^{T})
5	Exponentiation, power operator ($\wedge$)
6	Negation ($^-$)
7	String concatenation (&)
8	Multiplication ($\bullet$), division (/)
9	Addition (+), subtraction (-)
10	Equality relations: equal (=), not equal ($\neq$ or /=), less than (<), less than or equal ($\leq$ or <=), greater than (>), greater than or equal ($\geq$ or >=)
11	Logical **not**
12	Logical **and**
13	Logical **or**
14	**xor**, **nor**, **nand**
15	Logical implication ($\Rightarrow$)
16	Logical double implication, XNOR ($\Leftrightarrow$)
17	Constraint operator ("|")
18	Store ($\rightarrow$)

Parentheses, Brackets, and Braces

All calculations inside a pair of parentheses, brackets, or braces are evaluated first. For example, in the expression 4(1+2), EOS™ software first evaluates the portion of the expression inside the parentheses, 1+2, and then multiplies the result, 3, by 4.

The number of opening and closing parentheses, brackets, and braces must be the same within an expression or equation. If not, an error message is displayed that indicates the missing element. For example, (1+2)/(3+4 will display the error message "Missing)."

Note: Because the TI-Nspire™ CAS software allows you to define your own functions, a variable name followed by an expression in parentheses is considered a "function call" instead of implied multiplication. For example a(b+c) is the function a evaluated by b+c. To multiply the expression b+c by the variable a, use explicit multiplication: a•(b+c).

Indirection

The indirection operator (#) converts a string to a variable or function name. For example, #("x"&"y"&"z") creates the variable name xyz. Indirection also allows the creation and modification of variables from inside a program. For example, if 10→r and "r"→s1, then #s1=10.

Post Operators

Post operators are operators that come directly after an argument, such as 5!, 25%, or 60°15' 45". Arguments followed by a post operator are evaluated at the fourth priority level. For example, in the expression 4^3!, 3! is evaluated first. The result, 6, then becomes the exponent of 4 to yield 4096.

Exponentiation

Exponentiation (^) and element-by-element exponentiation (.^) are evaluated from right to left. For example, the expression 2^3^2 is evaluated the same as 2^(3^2) to produce 512. This is different from (2^3)^2, which is 64.

Negation

To enter a negative number, press [(-)] followed by the number. Post operations and exponentiation are performed before negation. For example, the result of $-x^2$ is a negative number, and $-9^2 = -81$. Use parentheses to square a negative number such as $(-9)^2$ to produce 81.

Constraint ("|")

The argument following the constraint ("|") operator provides a set of constraints that affect the evaluation of the argument preceding the operator.

TI-Nspire CX II - TI-Basic Programming Features
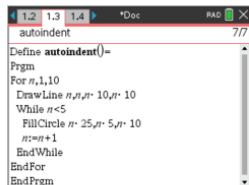

Auto-indentation in Programming Editor

The TI-Nspire™ program editor now auto-indents statements inside a block command.

Block commands are If/EndIf, For/EndFor, While/EndWhile, Loop/EndLoop, Try/EndTry

The editor will automatically prepend spaces to program commands inside a block command. The closing command of the block will be aligned with the opening command.

The example below shows auto-indentation in nested block commands.

Code fragments that are copied and pasted will retain the original indentation.

Opening a program created in an earlier version of the software will retain the original indentation.

Improved Error Messages for TI-Basic
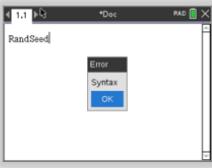

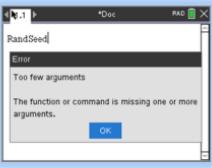

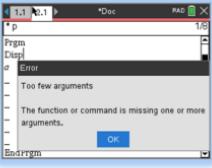

Errors
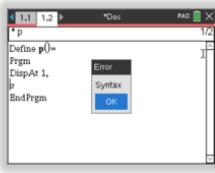

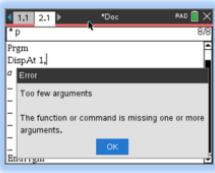

Error Condition	New message
Error in condition statement (**If/While**)	A conditional statement did not resolve to **TRUE** or **FALSE** **NOTE:** With the change to place the cursor on the line with the error, we no longer need to specify if the error is in an "**If**" statement or a "**While**" statement.
Missing **EndIf**	Expected **EndIf** but found a different end statement
Missing **EndFor**	Expected **EndFor** but found a different end statement
Missing **EndWhile**	Expected **EndWhile** but found a different end statement
Missing **EndLoop**	Expected **EndLoop** but found a different end statement

Error Condition	New message
Missing **EndTry**	Expected **EndTry** but found a different end statement
"**Then**" omitted after **If** <condition>	Missing **If..Then**
"**Then**" omitted after **ElseIf** <condition>	**Then** missing in block: **ElseIf**.
When "**Then**", "**Else**" and "**ElseIf**" were encountered outside of control blocks	**Else** invalid outside of blocks: **If..Then..EndIf** or **Try..EndTry**
"**ElseIf**" appears outside of "**If..Then..EndIf**" block	**ElseIf** invalid outside of block: **If..Then..EndIf**
"**Then**" appears outside of "**If....EndIf**" block	**Then** invalid outside of block: **If..EndIf**
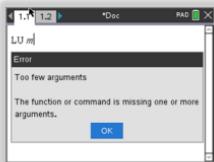

Syntax Errors

In case commands that expect one or more arguments are called with an incomplete list of arguments, a "**Too few argument error**" will be issued instead of "**syntax**" error

Current behavior	New CX II behavior

Current behavior	New CX II behavior

Note: When an incomplete list of arguments is not followed by a comma, the error message is: "too few arguments". This is the same as previous releases.

Constants and Values

The following table lists the constants and their values that are available when performing unit conversions. They can be typed in manually or selected from the **Constants** list in **Utilities > Unit Conversions** (Handheld: Press 📖 **3**).

Constant	Name	Value
_c	Speed of light	299792458 _m/_s
_Cc	Coulomb constant	8987551787.3682 _m/_F
_Fc	Faraday constant	96485.33289 _coul/_mol
_g	Acceleration of gravity	9.80665 _m/_s^2
_Gc	Gravitational constant	6.67408E-11 _m^3/_kg/_s^2
_h	Planck's constant	6.626070040E-34 _J _s
_k	Boltzmann's constant	1.38064852E-23 _J/_°K
_μ0	Permeability of a vacuum	1.2566370614359E-6 _N/_A^2
_μb	Bohr magneton	9.274009994E-24 _J _m^2/_Wb
_Me	Electron rest mass	9.10938356E-31 _kg
_Mμ	Muon mass	1.883531594E-28 _kg
_Mn	Neutron rest mass	1.674927471E-27 _kg
_Mp	Proton rest mass	1.672621898E-27 _kg
_Na	Avogadro's number	6.022140857E23 /_mol
_q	Electron charge	1.6021766208E-19 _coul
_Rb	Bohr radius	5.2917721067E-11 _m
_Rc	Molar gas constant	8.3144598 _J/_mol/_°K
_Rdb	Rydberg constant	10973731.568508/_m
_Re	Electron radius	2.8179403227E-15 _m
_u	Atomic mass	1.660539040E-27 _kg
_Vm	Molar volume	2.2413962E-2 _m^3/_mol
_ε0	Permittivity of a vacuum	8.8541878176204E-12 _F/_m
_σ	Stefan-Boltzmann constant	5.670367E-8 _W/_m^2/_°K^4
_φ0	Magnetic flux quantum	2.067833831E-15 _Wb

Error Codes and Messages

When an error occurs, its code is assigned to variable *errCode*. User-defined programs and functions can examine *errCode* to determine the cause of an error. For an example of using *errCode*, See Example 2 under the **Try** command, page 191.

Note: Some error conditions apply only to TI-Nspire™ CAS products, and some apply only to TI-Nspire™ products.

Error code	Description
10	A function did not return a value
20	A test did not resolve to TRUE or FALSE. Generally, undefined variables cannot be compared. For example, the test If a<b will cause this error if either a or b is undefined when the If statement is executed.
30	Argument cannot be a folder name.
40	Argument error
50	Argument mismatch Two or more arguments must be of the same type.
60	Argument must be a Boolean expression or integer
70	Argument must be a decimal number
90	Argument must be a list
100	Argument must be a matrix
130	Argument must be a string
140	Argument must be a variable name. Make sure that the name: • does not begin with a digit • does not contain spaces or special characters • does not use underscore or period in invalid manner • does not exceed the length limitations See the Calculator section in the documentation for more details.
160	Argument must be an expression
165	Batteries too low for sending or receiving Install new batteries before sending or receiving.
170	Bound The lower bound must be less than the upper bound to define the search interval.

Error code	Description
180	Break The `esc` or `⌂ on` key was pressed during a long calculation or during program execution.
190	Circular definition This message is displayed to avoid running out of memory during infinite replacement of variable values during simplification. For example, a+1->a, where a is an undefined variable, will cause this error.
200	Constraint expression invalid For example, solve(3x^2-4=0,x) | x<0 or x>5 would produce this error message because the constraint is separated by "or" instead of "and."
210	Invalid Data type An argument is of the wrong data type.
220	Dependent limit
230	Dimension A list or matrix index is not valid. For example, if the list {1,2,3,4} is stored in L1, then L1[5] is a dimension error because L1 only contains four elements.
235	Dimension Error. Not enough elements in the lists.
240	Dimension mismatch Two or more arguments must be of the same dimension. For example, [1,2]+[1,2,3] is a dimension mismatch because the matrices contain a different number of elements.
250	Divide by zero
260	Domain error An argument must be in a specified domain. For example, **rand(0)** is not valid.
270	Duplicate variable name
280	Else and ElseIf invalid outside of If…EndIf block
290	EndTry is missing the matching Else statement
295	Excessive iteration
300	Expected 2 or 3-element list or matrix
310	The first argument of **nSolve** must be an equation in a single variable. It cannot contain a non-valued variable other than the variable of interest.
320	First argument of solve or cSolve must be an equation or inequality For example, solve(3x^2-4,x) is invalid because the first argument is not an equation.

Error code	Description
345	Inconsistent units
350	Index out of range
360	Indirection string is not a valid variable name
380	Undefined Ans Either the previous calculation did not create Ans, or no previous calculation was entered.
390	Invalid assignment
400	Invalid assignment value
410	Invalid command
430	Invalid for the current mode settings
435	Invalid guess
440	Invalid implied multiply For example, x(x+1) is invalid; whereas, x*(x+1) is the correct syntax. This is to avoid confusion between implied multiplication and function calls.
450	Invalid in a function or current expression Only certain commands are valid in a user-defined function.
490	Invalid in Try..EndTry block
510	Invalid list or matrix
550	Invalid outside function or program A number of commands are not valid outside a function or program. For example, **Local** cannot be used unless it is in a function or program.
560	Invalid outside Loop..EndLoop, For..EndFor, or While..EndWhile blocks For example, the Exit command is valid only inside these loop blocks.
565	Invalid outside program
570	Invalid pathname For example, \var is invalid.
575	Invalid polar complex
580	Invalid program reference Programs cannot be referenced within functions or expressions such as 1+p(x) where p is a program.

Error code	Description
600	Invalid table
605	Invalid use of units
610	Invalid variable name in a Local statement
620	Invalid variable or function name
630	Invalid variable reference
640	Invalid vector syntax
650	Link transmission A transmission between two units was not completed. Verify that the connecting cable is connected firmly to both ends.
665	Matrix not diagonalizable
670	Low Memory 1. Delete some data in this document 2. Save and close this document If 1 and 2 fail, pull out and re-insert batteries
672	Resource exhaustion
673	Resource exhaustion
680	Missing (
690	Missing)
700	Missing "
710	Missing]
720	Missing }
730	Missing start or end of block syntax
740	Missing Then in the If…EndIf block
750	Name is not a function or program
765	No functions selected
780	No solution found
800	Non-real result For example, if the software is in the Real setting, $\sqrt{(-1)}$ is invalid.

Error code	Description
	To allow complex results, change the "Real or Complex" Mode Setting to RECTANGULAR or POLAR.
830	Overflow
850	Program not found
	A program reference inside another program could not be found in the provided path during execution.
855	Rand type functions not allowed in graphing
860	Recursion too deep
870	Reserved name or system variable
900	Argument error
	Median-median model could not be applied to data set.
910	Syntax error
920	Text not found
930	Too few arguments
	The function or command is missing one or more arguments.
940	Too many arguments
	The expression or equation contains an excessive number of arguments and cannot be evaluated.
950	Too many subscripts
955	Too many undefined variables
960	Variable is not defined
	No value is assigned to variable. Use one of the following commands: • sto → • **:=** • **Define** to assign values to variables.
965	Unlicensed OS
970	Variable in use so references or changes are not allowed
980	Variable is protected
990	Invalid variable name
	Make sure that the name does not exceed the length limitations

Error code	Description
1000	Window variables domain
1010	Zoom
1020	Internal error
1030	Protected memory violation
1040	Unsupported function. This function requires Computer Algebra System. Try TI-Nspire™ CAS.
1045	Unsupported operator. This operator requires Computer Algebra System. Try TI-Nspire™ CAS.
1050	Unsupported feature. This operator requires Computer Algebra System. Try TI-Nspire™ CAS.
1060	Input argument must be numeric. Only inputs containing numeric values are allowed.
1070	Trig function argument too big for accurate reduction
1080	Unsupported use of Ans. This application does not support Ans.
1090	Function is not defined. Use one of the following commands: • **Define** • **:=** • sto → to define a function.
1100	Non-real calculation For example, if the software is in the Real setting, $\sqrt{(-1)}$ is invalid. To allow complex results, change the "Real or Complex" Mode Setting to RECTANGULAR or POLAR.
1110	Invalid bounds
1120	No sign change
1130	Argument cannot be a list or matrix
1140	Argument error The first argument must be a polynomial expression in the second argument. If the second argument is omitted, the software attempts to select a default.
1150	Argument error The first two arguments must be polynomial expressions in the third argument. If the third argument is omitted, the software attempts to select a default.
1160	Invalid library pathname

Error code	Description
	A pathname must be in the form *xxx\yyy*, where: • The *xxx* part can have 1 to 16 characters. • The *yyy* part can have 1 to 15 characters. See the Library section in the documentation for more details.
1170	Invalid use of library pathname • A value cannot be assigned to a pathname using **Define**, **:=**, or sto →. • A pathname cannot be declared as a Local variable or be used as a parameter in a function or program definition.
1180	Invalid library variable name. Make sure that the name: • Does not contain a period • Does not begin with an underscore • Does not exceed 15 characters See the Library section in the documentation for more details.
1190	Library document not found: • Verify library is in the MyLib folder. • Refresh Libraries. See the Library section in the documentation for more details.
1200	Library variable not found: • Verify library variable exists in the first problem in the library. • Make sure library variable has been defined as LibPub or LibPriv. • Refresh Libraries. See the Library section in the documentation for more details.
1210	Invalid library shortcut name. Make sure that the name: • Does not contain a period • Does not begin with an underscore • Does not exceed 16 characters • Is not a reserved name See the Library section in the documentation for more details.
1220	Domain error: The tangentLine and normalLine functions support real-valued functions only.
1230	Domain error.

Error code	Description
	Trigonometric conversion operators are not supported in Degree or Gradian angle modes.
1250	Argument Error Use a system of linear equations. Example of a system of two linear equations with variables x and y: 3x+7y=5 2y-5x=-1
1260	Argument Error: The first argument of **nfMin** or **nfMax** must be an expression in a single variable. It cannot contain a non-valued variable other than the variable of interest.
1270	Argument Error Order of the derivative must be equal to 1 or 2.
1280	Argument Error Use a polynomial in expanded form in one variable.
1290	Argument Error Use a polynomial in one variable.
1300	Argument Error The coefficients of the polynomial must evaluate to numeric values.
1310	Argument error: A function could not be evaluated for one or more of its arguments.
1380	Argument error: Nested calls to domain() function are not allowed.

Warning Codes and Messages

You can use the **warnCodes()** function to store the codes of warnings generated by evaluating an expression. This table lists each numeric warning code and its associated message. For an example of storing warning codes, see **warnCodes()**, page 200.

Warning code	Message
10000	Operation might introduce false solutions.
10001	Differentiating an equation may produce a false equation.
10002	Questionable solution
10003	Questionable accuracy
10004	Operation might lose solutions.
10005	cSolve might specify more zeros.
10006	Solve may specify more zeros.
10007	More solutions may exist. Try specifying appropriate lower and upper bounds and/or a guess. Examples using solve(): • solve(Equation, Var=Guess)|lowBound<Var<upBound • solve(Equation, Var)|lowBound<Var<upBound • solve(Equation, Var=Guess)
10008	Domain of the result might be smaller than the domain of the input.
10009	Domain of the result might be larger than the domain of the input.
10012	Non-real calculation
10013	$\infty{\wedge}0$ or undef^0 replaced by 1
10014	undef^0 replaced by 1
10015	$1{\wedge}\infty$ or 1^undef replaced by 1
10016	1^undef replaced by 1
10017	Overflow replaced by ∞ or $-\infty$
10018	Operation requires and returns 64 bit value.
10019	Resource exhaustion, simplification might be incomplete.
10020	Trig function argument too big for accurate reduction.
10021	Input contains an undefined parameter. Result might not be valid for all possible parameter values.

Warning code	Message
10022	Specifying appropriate lower and upper bounds might produce a solution.
10023	Scalar has been multiplied by the identity matrix.
10024	Result obtained using approximate arithmetic.
10025	Equivalence cannot be verified in EXACT mode.
10026	Constraint might be ignored. Specify constraint in the form "\" 'Variable MathTestSymbol Constant' or a conjunct of these forms, for example 'x<3 and x>-12'
