## THE LIGHT SIDE OF TRIGONOMETRY

Part 1: SUNRISE DATA - Melbourne 2001

|  | Sunrise |  |  |  |  | Sunset |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Dav | Hours | Mins | Total | Hours | Mins | Total | Davliaht |
| $\mathbf{3 0}$ | 5 | 31 | 331 | 19 | 34 | 1174 | 843 |
| $\mathbf{6 0}$ | 6 | 4 | 364 | 18 | 59 | 1139 | 775 |
| $\mathbf{9 0}$ | 6 | 32 | 392 | 18 | 15 | 1095 | 703 |
| $\mathbf{1 2 0}$ | 6 | 59 | 419 | 17 | 34 | 1054 | 635 |
| $\mathbf{1 5 0}$ | 7 | 24 | 444 | 17 | 10 | 1030 | 586 |
| $\mathbf{1 8 0}$ | 7 | 35 | 455 | 17 | 11 | 1031 | 576 |
| $\mathbf{2 1 0}$ | 7 | 22 | 442 | 17 | 30 | 1050 | 608 |
| $\mathbf{2 4 0}$ | 6 | 47 | 407 | 17 | 55 | 1075 | 668 |
| $\mathbf{2 7 0}$ | 6 | 2 | 362 | 18 | 20 | 1100 | 738 |
| $\mathbf{3 0 0}$ | 5 | 19 | 319 | 18 | 38 | 1118 | 799 |
| $\mathbf{3 3 0}$ | 4 | 54 | 294 | 19 | 20 | 1160 | 866 |
| $\mathbf{3 6 0}$ | $\mathbf{4}$ | 58 | $\mathbf{2 9 8}$ | 19 | 43 | 1183 | 885 |
|  |  |  |  |  |  |  |  |

Sunrise - Melbourne 2001
Sinusoidal Regression
regEQ(x) $=79.1246 * \sin (.016573 * x+-1.20082)+373.462$
$\mathrm{a}=79.1246$
$\mathrm{b}=.016573$
c $=-1.20082$
$\mathrm{d}=373.462$
Sunrise Data - Melbourne 2001

## Amplitude: <br> a_

79.1246

## Period:

b .016573
$\frac{2 \cdot \pi}{b}$
379.118

## Horizontal translation:

$\frac{c_{-}}{b_{-}}$
-72.4557

## Vertical translation:

d_
373.462

Hence the model for Melbourne's sunrise is:

$$
\begin{aligned}
\mathrm{y}(\mathrm{x}) & :=79.1246 \cdot \sin (0.016573 \cdot(\mathrm{x}-72.4557))+373.462 \\
& \text { 'Done" }
\end{aligned}
$$

To check the accuracy of the rule we can substitute in the day value for October 15th into the general rule.
$\mathrm{y}(288) \quad 340.432$

Calculations:

| Hours: <br> ans <br> 60 | 5.67387 | Minutes: |  |
| :--- | :--- | :--- | :--- |
|  |  | fpart(ans) $\cdot 60$ | 40.4325 |

This is equivalent to 5 hours and 40 minutes from midnight. Hence 5:40 am

The "Sun Cycle" program gave the time of Melbourne's sunrise as 5:35 am.
Our result is approximately 5 minutes "out."

## Part 2: SUNSET DATA - Melbourne 2001

| Dav | Sunrise | Hours | Mins | Total | Sunset | Hours | Mins |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Total | Davliaht |  |  |  |  |  |  |
| $\mathbf{3 0}$ | 5 | 31 | 331 | 19 | 34 | 1174 | 843 |
| $\mathbf{6 0}$ | 6 | 4 | 364 | 18 | 59 | 1139 | 775 |
| $\mathbf{9 0}$ | 6 | 32 | 392 | 18 | 15 | 1095 | 703 |
| $\mathbf{1 2 0}$ | 6 | 59 | 419 | 17 | 34 | 1054 | 635 |
| $\mathbf{1 5 0}$ | 7 | 24 | 444 | 17 | 10 | 1030 | 586 |
| $\mathbf{1 8 0}$ | 7 | 35 | 455 | 17 | 11 | 1031 | 576 |
| $\mathbf{2 1 0}$ | 7 | 22 | 442 | 17 | 30 | 1050 | 608 |
| $\mathbf{2 4 0}$ | 6 | 47 | 407 | 17 | 55 | 1075 | 668 |
| $\mathbf{2 7 0}$ | 6 | 2 | 362 | 18 | 20 | 1100 | 738 |
| $\mathbf{3 0 0}$ | 5 | 19 | 319 | 18 | 38 | 1118 | 799 |
| $\mathbf{3 3 0}$ | 4 | 54 | 294 | 19 | 20 | 1160 | 866 |
| $\mathbf{3 6 0}$ | $\mathbf{4}$ | 58 | $\mathbf{2 9 8}$ | 19 | 43 | 1183 | 885 |

Sunrise - Melbourne 2001
Sinusoidal Regression
$\operatorname{regEQ}(\mathrm{x})=79.1842 * \sin \left(.015335^{*} \mathrm{x}+1.95061\right)+1111.24$
$\mathrm{a}=79.1842$
b $=.015335$
c $=1.95061$
$\mathrm{d}=1111.24$

## Sunset Data - Melbourne 2001

Amplitude:
a_
79.1842

Period:
b .015335
$\frac{2 \cdot \pi}{b}$
409.741

## Horizontal translation:

$\frac{c_{-}}{b_{-}}$
127.204

## Vertical translation:

d_
1111.24

Hence the model for Melbourne's sunset is:
$\mathrm{y}(\mathrm{x}):=79.1842 \cdot \sin (0.015335 \cdot(\mathrm{x}+127.204))+1111.24$
'Done"

To check the accuracy of the rule we can substitute in the day value for October 15th into the general rule.
$y(288) \quad 1117.88$

This is equivalent to 18 hours and 38 minutes from midnight. Hence 6:38 pm
Calculations:

| Hours: <br> ans <br> 60 | 18.6314 | Minutes: |  |
| :--- | :--- | :--- | :--- |
|  |  | fpart(ans).60 | 37.8811 |

The "Sun Cycle" program gave the time of Melbourne's sunset as 6:36 pm.
Our result is approximately 2 minutes "out."

## Part 3: DAYLIGHT MINUTES - Melbourne 2001

| Dav | Sunrise <br> Hours | Mins | Total | Sunset |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Hours | Mins | Total | Dav1ight |  |  |  |  |
| $\mathbf{3 0}$ | 5 | 31 | 331 | 19 | 34 | 1174 | 843 |
| $\mathbf{6 0}$ | 6 | 4 | 364 | 18 | 59 | 1139 | 775 |
| $\mathbf{9 0}$ | 6 | 32 | 392 | 18 | 15 | 1095 | 703 |
| $\mathbf{1 2 0}$ | 6 | 59 | 419 | 17 | 34 | 1054 | 635 |
| $\mathbf{1 5 0}$ | 7 | 24 | 444 | 17 | 10 | 1030 | 586 |
| $\mathbf{1 8 0}$ | 7 | 35 | 455 | 17 | 11 | 1031 | 576 |
| $\mathbf{2 1 0}$ | 7 | 22 | 442 | 17 | 30 | 1050 | 608 |
| $\mathbf{2 4 0}$ | 6 | 47 | 407 | 17 | 55 | 1075 | 668 |
| $\mathbf{2 7 0}$ | 6 | 2 | 362 | 18 | 20 | 1100 | 738 |
| $\mathbf{3 0 0}$ | 5 | 19 | 319 | 18 | 38 | 1118 | 799 |
| $\mathbf{3 3 0}$ | 4 | 54 | 294 | 19 | 20 | 1160 | 866 |
| $\mathbf{3 6 0}$ | $\mathbf{4}$ | 58 | $\mathbf{2 9 8}$ | 19 | 43 | 1183 | 885 |

Daylight minutes - Melbourne 2001
Sinusoidal Regression
regEQ $(x)=153.647 * \sin (.016485 * x+1.85837)+731.992$
$\mathrm{a}=153.647$
b $=.016485$
c $=1.85837$
$\mathrm{d}=731.992$

Daylight minutes - Melbourne 2001

## Amplitude: <br> a_

153.647

Period:
b .016485
$\frac{2 \cdot \pi}{b}$
381.155

## Vertical translation:

d_
731.992

Hence the model for the number of daylight minutes for Melbourne is:
$y(x):=153.647 \cdot \sin (0.016485 \cdot(x+112.733))+731.992$
'Done"

To check the accuracy of the rule we can substitute in the day value for October 15th into the general rule.
y (288) $\quad 780.747$

This is equivalent to 13 hours and 1 minute for the day.
Calculations:

| Hours: <br> ans <br> 60 | 13.0124 | Minutes: |  |
| :--- | :--- | :--- | :--- |
|  |  | fpart(ans).60 | .746699 |

The "Sun Cycle" program gave the daylight hours for Melbourne as 13 hours and 1 minute.
Our rule gives exactly the same result!

The graph of sunrise, sunset and daylight minutes on the same set of axes is as follows:
Sunrise, Sunset and Daylight minutes

Sunset
Daylight minutes
Sunrise

The solstice marks the longest and shortest days of the year.

## Winter Solstice:

The minimum value of daylight hours occurs at (173.128, 578.345)
Day 173 of the year corresponds to June 22nd. The actual value is June 21st - so our result is one day out!

## Summer Solstice:

The maximum value of daylight hours occurs at (360., 885.353)
Day 360 of the year corresponds to December 26th. The actual value is December 22nd - so our result is four days out.

## Equinox:

The equinox is defined as the point where there are an equal number of daylight and night minutes.
This corresponds to 12 hours or 720 minutes. We can use the equation $\mathrm{y}(\mathrm{x})=153.647 \cdot \sin (0.016485 \cdot(\mathrm{x}+112.733))+731.992$ where $\mathrm{y}(\mathrm{x})=720$ and solve for $x$.

$$
\begin{aligned}
& \text { Solve }(720=153.647 \cdot \sin (0.016485 \cdot(x+112.733))+731.992, x) \mid 0<x \text { AND } x<365 \\
& \quad x=263.673 \text { or } x=82.5792
\end{aligned}
$$

Day 83 corresponds to March 24th. The actual value of the Autumnal equinox is day 80 - March 21st, so our result is out by three days.

Day 263 corresponds to September 20th. The actual value of the Spring equinox is day 264 - September 21st, so our result is out by one day.

Using the graph and finding the point of intersection with $\mathrm{y}=720$ yields the following points:
Autumnal equinox: (82.5812, 720.)
Spring equinox: (263.675, 720.)

Sunrise, Sunset and Daylight minutes

The average number of daylight hours for Melbourne can be determined from the table of daylight minutes.

The spreadsheet in part 1 indicates that the average from the twelve data points taken is 723.5 . Hence there are, on average, 12 hours and 3 minutes of daylight per day in Melbourne.

## Part 4: GENERALIZING THE EQUATION

The longitude selected was $144^{\circ} \cdot 58^{\prime}$ East with a corresponding time zone of +10 hours. The pair of latitudes selected were $50^{\circ}$.North and $50^{\circ}$.South .

## 50 DEGREES - South

| 50 Degrees South |  |  | Total | Hours | Minutes | Total | Daylight |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Day | Hours | Minutes |  |  |  |  |  |
| 30 | 4 | 59 | 299 | 20 | 10 | 1210 | 911 |
| 60 | 5 | 52 | 352 | 19 | 15 | 1155 | 803 |
| 90 | 6 | 40 | 400 | 18 | 11 | 1091 | 691 |
| 120 | 7 | 26 | 446 | 17 | 11 | 1031 | 585 |
| 150 | 8 | 6 | 486 | 16 | 32 | 992 | 506 |
| 180 | 8 | 22 | 502 | 16 | 29 | 989 | 487 |
| 210 | 7 | 58 | 478 | 16 | 59 | 1019 | 541 |
| 240 | 7 | 5 | 425 | 17 | 42 | 1062 | 637 |
| 270 | 6 | 0 | 360 | 18 | 26 | 1106 | 746 |
| 300 | 4 | 58 | 298 | 19 | 14 | 1154 | 856 |
| 330 | 4 | 14 | 254 | 20 | 4 | 1204 | 950 |
| 360 | 4 | 11 | 251 | 20 | 33 | 1233 | 982 |

50 Degrees South
Sinusoidal Regression
regEQ $(x)=244.478 * \sin (.016536 * x+1.85846)+737.291$
a $=244.478$
b $=.016536$
c $=1.85846$
$\mathrm{d}=737.291$

## Amplitude:

$\mathrm{a}_{-} \rightarrow$ a50s $\quad 244.478$

## Period:

$\mathrm{b}_{-} \rightarrow$ b50s . 016536
$\frac{2 \cdot \pi}{\mathrm{~b}_{-}} \rightarrow \mathrm{p} 50 \mathrm{~s} \quad 379.961$

## Horizontal Translation:

$\frac{c_{-}}{b_{-}} \rightarrow \mathrm{c} 50 \mathrm{~s}$
112.386

Vertical Translation:
d_ $\rightarrow$ d50s
737.291

Hence, the final equation is:
$S(x):=244.478 \cdot \sin (0.016536 \cdot(x+112.386))+737.291 \quad$ "Done"

Testing this equation for October 15th - day 288.

S(288) 818.267

This is equivalent to 13 hours and 38 minutes for the day.
Calculations:

Hours:
$\frac{\text { ans }}{60} \quad 13.6378$

Minutes:
fpart(ans). $60 \quad 38.2673$

The "Sun Cycle" program gave the daylight hours as 13 hours and 32 minutes.
Our result is approximately 6 minutes "out."

## 50 DEGREES - North

| 50 Degrees North |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Day | Hours | Minutes | Tota1 | Hours | Minutes | Tota1 | Day1ight |  |
| 30 | 7 | 59 | 479 | 17 | 12 | 1032 | 553 |  |
| 60 | 7 | 6 | 426 | 18 | 3 | 1083 | 657 |  |
| 90 | 6 | 1 | 361 | 18 | 51 | 1131 | 770 |  |
| 120 | 5 | 1 | 301 | 19 | 38 | 1178 | 877 |  |
| 150 | 4 | 19 | 259 | 20 | 20 | 1220 | 961 |  |
| 180 | 4 | 15 | 255 | 20 | 35 | 1235 | 980 |  |
| 210 | 4 | 46 | 286 | 20 | 9 | 1209 | 923 |  |
| 240 | 5 | 30 | 330 | 19 | 15 | 1155 | 825 |  |
| 270 | 6 | 15 | 375 | 18 | 10 | 1090 | 715 |  |
| 300 | 7 | 2 | 422 | 17 | 8 | 1028 | 606 |  |
| 330 | 7 | 51 | 471 | 16 | 27 | 987 | 516 |  |
| 360 | 8 | 19 | 499 | 16 | 25 | 985 | 486 |  |
|  |  |  |  |  |  |  |  |  |

50 Degrees North
Sinusoidal Regression
regEQ $(x)=242.442 * \sin (.016813 * x+-1.33212)+730.428$
a $=242.442$
b $=.016813$
c $=-1.33212$
$\mathrm{d}=730.428$

## Amplitude:

a_ $\rightarrow$ a50n
242.442

## Period:

b_ $\rightarrow$ b50n
.016813
$\frac{2 \cdot \pi}{\mathrm{~b}_{-}} \rightarrow \mathrm{p} 50 \mathrm{n}$
373.7

## Horizontal Translation:

$\frac{\mathrm{c}_{-}}{\mathrm{b}_{-}} \rightarrow \mathrm{c} 50 \mathrm{n}$
-79.2294

## Vertical Translation:

d_ $\rightarrow$ d50n
730.428

Hence, the final equation is:
$\mathrm{N}(\mathrm{x}):=242.442 \cdot \sin (0.016813 \cdot(\mathrm{x}-79.2294))+730.428 \quad$ "Done"

Testing this equation for October 15th - day 288.
$N(288) \quad 643.104$

This is equivalent to 10 hours and 43 minutes for the day.
Calculations:

Hours:
$\frac{\text { ans }}{60} \quad 10.7184$

Minutes:
fpart(ans). $60 \quad 43.1037$

The "Sun Cycle" program gave the daylight hours as 10 hours and 48 minutes.
Our result is approximately 5 minutes "out."

## Summary - Daylight minutes: 50 Degrees

| Degrees |  |  |
| :---: | :---: | :---: |
| Day | South | North |
| 30 | 911 | 553 |
| 60 | 803 | 657 |
| 90 | 691 | 770 |
| 120 | 585 | 877 |
| 150 | 506 | 961 |
| 180 | 487 | 980 |
| 210 | 541 | 923 |
| 240 | 637 | 825 |
| 270 | 746 | 715 |
| 300 | 856 | 606 |
| 330 | 950 | 516 |
| 360 | 982 | 486 |

## 50 Degrees - North and South

South
Minimum at (172.589, 492.813)
Maximum at (362.574, 981.769)

North
Minimum at (359.504, 487.986)
Maximum at $(172.654,972.87)$

Comparing the results for the Northern and Southern hemispheres:
The amplitude of each function is very close. The periods are almost identical. The vertical translations are also very close. This should be the case as the latitudes in the Northen hemisphere are a reflection of the latitudes in the Southern hemispheres about the equator.

The major difference is in the horizontal translation. The graphs are "out of phase" with each other by approximately pi radians. The effect of this is the same as reflecting the graph about the vertical translation.

Hence the graph of the Southern hemisphere is a reflection of the graph of the Northern hemisphere about the vertical translation. In a practical sense this corresponds to the Southern summer equating to the Northern winter.

## SUMMARY TABLE

|  |  |  |  |  | Horizontal | Vertical |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Amplitude | b | Period | Translation | Translation |
| North | 50 | 242.442 | 017 | 373.700 | -79.229 | 730.428 |
| North | 40 | 167.601 | . 017 | 373.233 | -79.220 | 728.642 |
| North | 30 | 110.428 | . 017 | 369.896 | -80.806 | 730.391 |
| North | 20 | 71.491 | . 017 | 371.479 | -79.737 | 727.612 |
| North | 10 | 34.493 | . 017 | 373.545 | -79.222 | 726.783 |
| South | -10 | 34.773 | 017 | 376.421 | 109.175 | 727.409 |
| South | -20 | 71.944 | . 017 | 376.248 | 109.492 | 728.380 |
| South | -30 | 114.502 | . 017 | 377.006 | 110.142 | 729.656 |
| South | -40 | 167.978 | . 017 | 377.757 | 110.741 | 732.185 |
| South | -50 | 244.478 | 017 | 379.961 | 112.386 | 737.291 |
| Average | N | 125.291 | . 017 | 372.371 | -79.643 | 728.771 |
| Average | S | 126.735 | 017 | 377.479 | 110.387 | 730.984 |

The significant features of the results are as follows:
Amplitude: the results for the northern and southern hemispheres are almost the same.
b value: the $b$ value for both hemispheres is exactly the same, correct to three decimal places.
Period: the period for both hemispheres is almost the same however, the southern hemisphere is slightly longer.

It was anticipated that the period for both hemispheres would have been 365 , corresponding to the number of days in the year. This result may have been affected due to the fact that only
twelve data points were used in each case over a period of one year. Hence, there was no repetition of the cycle evidenced in the data.

Horizontal translation: the translation in the northern hemisphere was approximately 79 degrees in a negative direction and 110 degrees for the southern hemisphere.

It was anticipated that the difference in translation would be equivalent to 180 degrees so that the graphs would be an exact reflection of each other about the vertical translation. The actual result however, was 189 degrees.

Vertical translation: the vertical translations for both hemisphere were about the same. It was anticipated that the vertical translation would be 720, corresponding to the number of minutes in half a day.

The reason why a different longitude will not affect the daylight minutes equation is because all places on a given longitude will be exposed to the sun in the same way throughout the course of a day. The only influence on the number of daylight minutes is the displacement from the equator. This is due to the fact that the earth rotates about a north-south axis which is inclined at an angle of 23.5 degrees relative to the sun. The orbit of the earth around the sun and the tilt on the axis causes the periodic variations in the amount of sunlight that hits the earth at a given place.

## Extension

In order to generalise the result of the amplitude it is necessary to determine a model for the data. A quadratic and a sinusoidal model have been calculated as the data seems to most closely resemble these functions.

## Latitude and Amplitude - Quadratic

Latitude and Amplitude
Quadratic Regression
regEQ $(x)=.084869 x^{\wedge} 2+-.022813 x+32.6569$
a $=.084869$
b $=-.022813$
c $=32.6569$

## Latitude and Amplitude - Sinusoidal

Latitude and Amplitude
Sinusoidal Regression
regEQ $(x)=355.851 * \sin (.023172 * x+-1.5741)+384.839$
a $=355.851$
$\mathrm{b}=.023172$
c $=-1.5741$
$\mathrm{d}=384.839$

While both models appear to fit the data quite well we have decided to use the sinusoidal model.

## General model for any point on the Earth:

1. Substitute the LATITUDE into the equation
$\mathrm{A}(\mathrm{x}):=\mathrm{a}_{-} \cdot \sin \left(\mathrm{b}_{-} \cdot \mathrm{x}+\mathrm{c}_{-}\right)+\mathrm{d}_{-}$
'Done"
$\mathrm{A}(40) \rightarrow$ Amp
170.266
2. For the Southern Hemisphere, substitute into the general equation

$$
\begin{aligned}
& \mathrm{SD}(\mathrm{x}):=\mathrm{Amp} \cdot \sin (0.017 \cdot(\mathrm{x}+110.387))+730.984 \\
& \text { 'Done" }
\end{aligned}
$$

For the Northern Hemisphere, substitute into the general equation
$\mathrm{ND}(\mathrm{x}):=\operatorname{Amp} \cdot \sin (0.017 \cdot(\mathrm{x}-79.643))+728.771$
"Done"
3. Substitute the DAY value required.

SD (30)
847.667

ND (30)
601.538

Comparing these result to the original data:
Sun Cycle data for day 30 at the 40th latitude
Northern Hemisphere: 606 minutes daylight
Southern Hemisphere: 853 minutes daylight

This result is reasonable considering the fact that the general equation includes an amplitude that is determined from a regression equation and values of $b, c$ and $d$ derived from averages of a series of regression equations themselves.
