

Class: Calculus

Topic: Application of Maximum-Minimum Problems

Purpose: To find the minimum cost of installing a new power line from a power station to a point on an island.

Problem: A power line is to be constructed from a power station at point A to an island at point C, which is 1 mile directly out in the water from a point B on the shore. Point B is 4 miles down shore from the power station at point A. It costs \$5000 per mile to lay the power line under water and \$3000 per mile to lay the line under ground. At what point S down shore from A should the line come to the shore in order to minimize cost?

1. From the Home key $\left[\text{Home} \right]$ press $\left[\text{6} \right]$ for a new document. If a screen pops up asking “Do you want to save ‘Unsaved Document’?” press \blacktriangleright to No and $\left[\text{2} \right]$ or $\left[\text{enter} \right]$.

If using a computer go to View and select Handheld Screen or TI-Nspire™ Handheld View.

Press $\left[\text{menu} \right]$, $\left[\text{2} \right]$ for View and $\left[\text{2} \right]$ for Plane Geometry View.

2. For this problem we will use a scale drawing. If the scale is not on the screen press $\left[\text{enter} \right]$ $\left[\text{2} \right]$ $\left[\text{7} \right]$ to show the scale.

Begin by constructing a rectangle.

$\left[\text{menu} \right]$, $\left[\text{8} \right]$ Shapes, $\left[\text{3} \right]$ Rectangle. Move \blacktriangleleft to top of and slightly to the left of center of screen. Press $\left[\text{enter} \right]$ $\left[\text{caps} \right]$ $\left[\text{C} \right]$ to name the point. Move \blacktriangleleft to the right keeping the segment as near horizontal as possible. Do not get too close to the scale. Press $\left[\text{enter} \right]$. Do not name the point. \blacktriangledown until you get a rectangle the size you want—about half way. Press $\left[\text{enter} \right]$ and $\left[\text{caps} \right]$ $\left[\text{B} \right]$ to label point in bottom left corner. To label the point in the bottom right corner place \blacktriangleleft on the vertex and press $\left[\text{menu} \right]$ \blacktriangleright $\left[\text{6} \right]$ $\left[\text{enter} \right]$ $\left[\text{caps} \right]$ $\left[\text{A} \right]$ $\left[\text{enter} \right]$ $\left[\text{esc} \right]$.

3. Change the scale from cm to miles(mi)

Place the cursor I on the scale and $\left[\text{2} \right]$ $\left[\text{2} \right]$. A flashing vertical bar should be located to right of m in cm. Press $\left[\text{clear} \right]$ $\left[\text{clear} \right]$ to remove cm and type $\left[\text{M} \right]$ $\left[\text{I} \right]$ for miles and press $\left[\text{enter} \right]$. See Figure 1.

Figure 1

4. Measure BC and AB and move measurements.

Press menu 7 1 for length. Place \uparrow on side BC. If the rectangle flashes press tab to find the length of side BC. Press enter enter . Move \uparrow to side AB and repeat the process. See Figure 2. Press esc .

Move measurements below the rectangle and to the right side. Place the cursor on the measurement for AB until the measurement flashes and the word text appears. See Figure 3. Press ctrl H . Hand will close. Use arrows to move the measurement. Press esc . Repeat the process for side BC. Drag the measurement below the value for AB and press esc .

5. Scale the drawing. Note: We have already changed the scale from cm to mi.

a. Copy the horizontal measurement. Move the cursor to the horizontal measurement until the hand appears and H H . Move the flashing vertical bar behind the number. Press and hold caps while pressing \leftarrow to highlight the number. Press ctrl C enter to copy the number.

b. Move \uparrow over the scale (1 mi) until X appears and H H . Move the flashing vertical bar behind the number. Press clear until the 1 is deleted. Press 4 (the distance from A to B in the problem.) enter ctrl V enter . See Figure 4. Note: The horizontal distance has changed to 4 miles.

c. The vertical distance has also changed but not to 1 mile which is the distance in the problem. See Figure 5. Move the cursor \uparrow over the vertical measurement and H H . Move the flashing vertical bar behind the number. Press clear until the number is removed and press 1 (the distance from the island to shore) enter . Note: This will change the size of the rectangle. See Figure 6 on the next page.

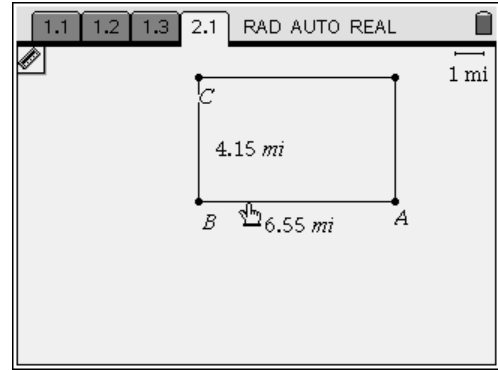

Figure 2

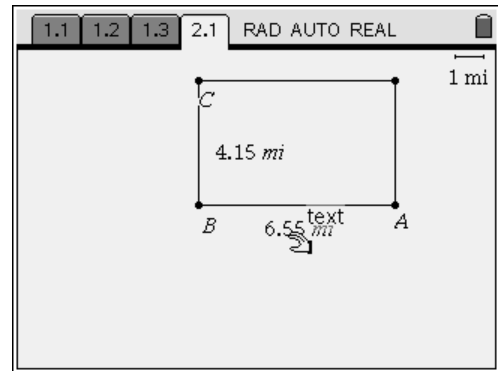

Figure 3

Figure 4

Figure 5

6. Construct segments BC and AB.

[menu] [6] [5] Place the cursor \blacktriangleright on point B and press [enter] . Move cursor \blacktriangleright to point C and press [enter] . Repeat the process to get segment AB. Place the cursor \blacktriangleright on B. [enter] Move the cursor \blacktriangleright to A. Press [enter] [esc] .

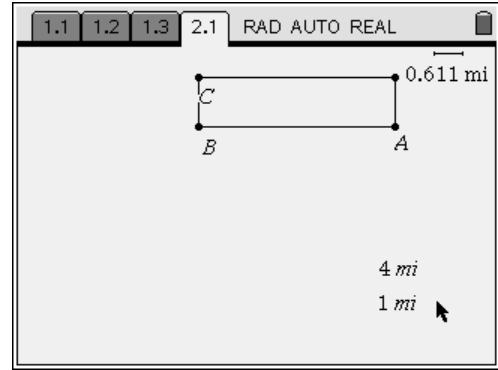

Figure 6

7. Hide the rectangle and the vertex not named.

Place the cursor \blacktriangleright on the rectangle until it flashes. If the segment flashes press [tab] . See Figure 7. Press [menu] [1] Actions [3] for Hide/Show and [enter] . Move the cursor \blacktriangleright to the unnamed vertex. Press [enter] and [esc] . See Figure 8.

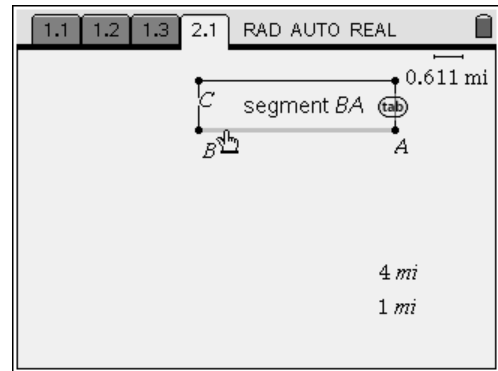

Figure 7

8. Construct segment CS where S is a point on AB.

[menu] [6] [5] . Move cursor \blacktriangleright to point C and [enter] . Move \blacktriangleright until you reach segment AB (about half way between A and B) and “point on” appears on the screen and press [enter] . See Figure 9. Be sure to label point S while in the segment mode and then [esc] .

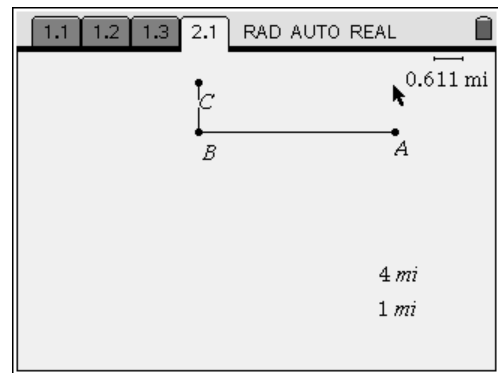

Figure 8

9. Construct segments BS and SA.

[menu] [6] [5] Place the cursor \blacktriangleright on point B and press [enter] . Move cursor \blacktriangleright to point S and press [enter] . Repeat the process to get segment SA. Place the cursor \blacktriangleright on S. [enter] Move the cursor \blacktriangleright to A. Press [enter] [esc] .

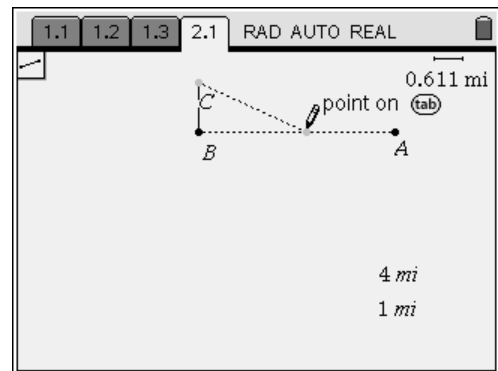

Figure 9

10. Measure segments BS and SA.

Press MENU 7 1 for length. Place \blacktriangleright on segment BS and press ENTER ENTER . Move \blacktriangleright to segment SA and repeat the process. Press ESC .

Move measurements below the rectangle and to the right side.

Place the cursor on the measurement for BS until the measurement flashes and the word text appears. Press CTRL 3 . Hand will close.

Use arrows to move the measurement.

Press ESC . Repeat the process for segment SA. Drag the measurement above the value for BS and press ESC . See Figure 10.

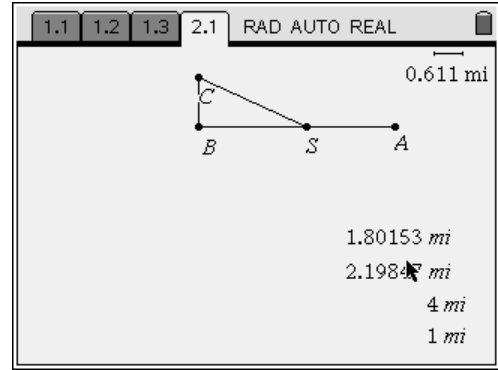

Figure 10

11. Label the lengths BS, SA, and BC as such.

Place \blacktriangleright on the measurement for BS and 3 . Press STO 1 . Hold down CAP while pressing B S ENTER . Repeat the process for SA and BC. See Figure 11. With BC flashing press CTRL 3 and move the value to the left of segment BC.

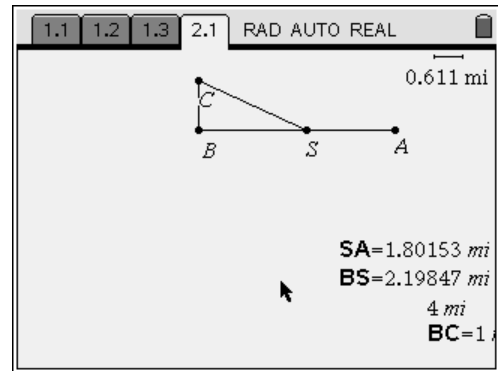

Figure 11

12. Use “text” to label CS and SA with $d = CS$ and $x = SA$.

Place \blacktriangleright near segment CS and press MENU 1 6 ENTER D ENTER . Move the d if necessary. Repeat the procedure for x and ESC . See Figure 12.

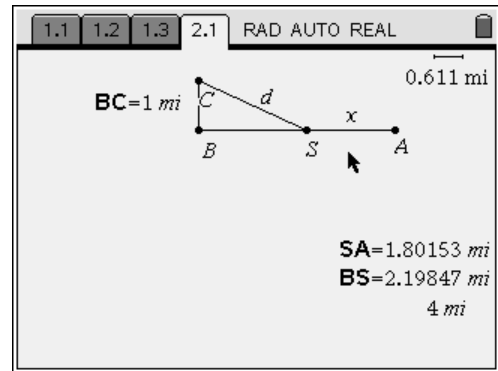

Figure 12

13. Write a formula for CS, calculate its current value, and assign a variable to the value.

a. Place \blacktriangleright below and to the left side of the drawing. MENU 1 6 ENTER . Type

$$CS = \sqrt{CB^2 + BS^2} \text{ ENTER ESC}$$

b. To calculate the current value place \blacktriangleright on CS until the segment flashes. Press MENU 7 1 ENTER ENTER ESC . Move the value below the formula for CS and ESC .

c. To assign a variable to CS place \blacktriangleright on the value for CS. Press 3 STO 1 and type D ENTER and ESC . See Figure 13.

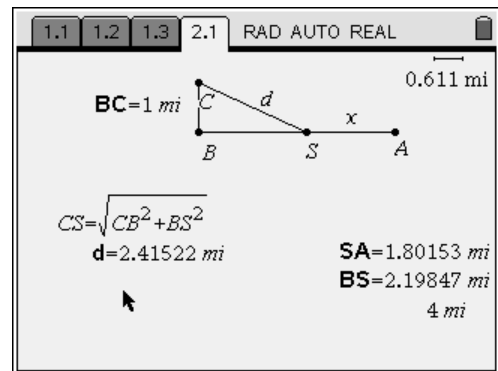

Figure 13

14. Determine a cost equation and assign a variable to the calculated value.
total cost = $5000d + 3000x$

Place \blacktriangleright below the value for d and press MENU 1 6 ENTER and type C O S T $=$ 5 0 0 0 D $+$ 3 0 0 0 X ENTER ESC .

To calculate the total cost using the current values press MENU 1 8 . Move \blacktriangleright to the cost equation until it flashes. Press ENTER . Move \blacktriangleright to the value for d and value flashes. See Figure 14. Press ENTER . Again you will get a text box asking you to select a value for x. Move \blacktriangleright to the value for SA (Rem: $x = SA$). Press ENTER . Move the \blacktriangleright off SA and a number will follow you. This is the cost for the given values of d and x. Move the value under the cost equation and press ENTER ESC .

To assign a variable to the cost value place \blacktriangleright on the value until the hand appears and the number flashes. Press F1 VAR 1 and type T C and press ENTER ESC . See Figure 15.

15. Open a Lists and Spreadsheet page. F2 3 .

\blacktriangle to A. Type L A N D and TAB to B and type W A T E R . TAB to C and type T O T A L C O S T and ENTER . \blacktriangleleft to formula line under A and press MENU 3 2 2 (to manually collect data later) and type S A and ENTER . Press \blacktriangleright \blacktriangle under B and press MENU 3 2 2 and type D . Press \blacktriangledown for the pull down menu and select Variable Reference and ENTER . Press \blacktriangleright \blacktriangle under C and press MENU 3 2 2 and type T C and ENTER . See Figure 16.

16. We are now ready to collect data for spreadsheet.

Press CTRL \blacktriangleleft to return to the Graphs and Geometry page. Grab point S (CTRL F5) and move it to the right until SA = 0. See Figure 17.

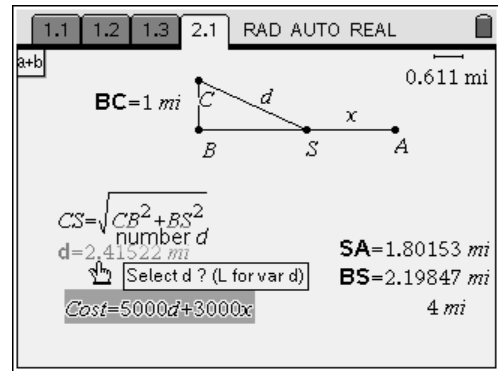

Figure 14

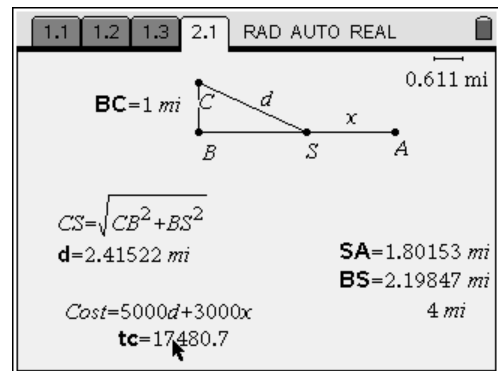

Figure 15

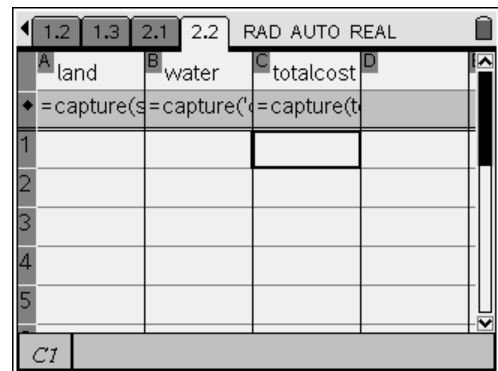

Figure 16

Figure 17

Press $\text{ctrl} \cdot$ to set the first point in the spreadsheet. Press $\text{ctrl} \blacktriangleright$. See Figure 18.

Note: The value for d is 4.12311 or $\sqrt{17}$
As it should be if we traveled by water only.

	A land	B water	C totalcost	D
1	0	4.12311	20615.5	
2				
3				
4				
5				

C1 =20615.528128089

Figure 18

17. Press $\text{ctrl} \blacktriangleleft$ to return to the previous page.

Place the cursor \blacktriangleright on Point S. Press $\text{ctrl} \textcircled{2}$ to get a closed hand. Move the closed hand to the left a few clicks (I use 5.) and press $\text{ctrl} \cdot$. Continue this process until Point S lies on top of Point B. Press $\text{ctrl} \cdot$ one last time and esc . See Figure 19.

Figure 19

18. Press $\text{ctrl} \blacktriangleright$ to look at the spreadsheet.

Note: The last value in the spreadsheet should be sa = 4, d = 1, and tc = 17000 (See Figure 20.) which represents the distance traveled along the legs of the triangle.

	A land	B water	C totalcost	D
11	3.0229	1.39811	16059.3	
12	3.32824	1.20468	16008.1	
13	3.63359	1.06502	16225.8	
14	3.93893	1.00186	16826.1	
15	4	1	17000	

B15 =1

Figure 20

Note: $\text{ctrl} \textcircled{G}$ will allow you to move to any row in the spreadsheet. Press $\text{ctrl} \textcircled{G} \textcircled{1}$ (See Figure 21.) and enter to move to Row 1 in the spreadsheet.

OK Cancel

Figure 21

19. Add a Graphs and Geometry page.

Press ctrl 2 .

Set the graph type to Scatter Plot.

Press menu 3 4 enter . Use the \blacktriangledown to select

“water” as the independent variable and enter .

Press tab enter and \blacktriangledown to select “totalcost” as the

dependent variable (See Figure 22.) and enter .

Press ctrl G to hide the entry line.

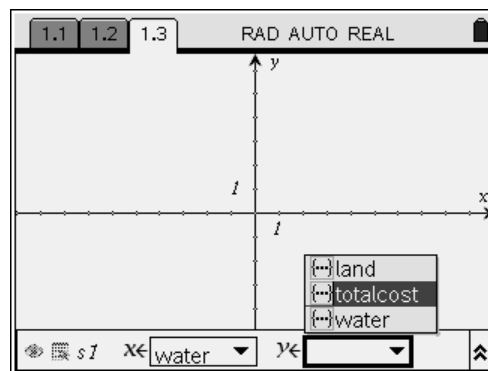

Figure 22

20. Set the window so we can view the data.

Press menu 2 8 to show axes end values.

Place the cursor \blacktriangleright on the y-min and press 2 nd 2 .

Press left 2 tab which carries you to the y-max. Type 2 2 0 0 0 and tab to x-max. Type 6 and tab to y-min and type 1 0 0 0 0 and tab and esc esc .

See Figure 23.

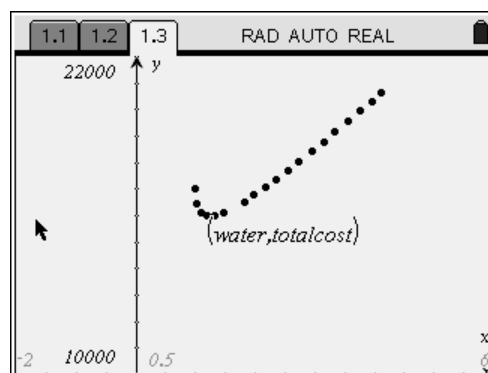

Figure 23

21. Before proceeding copy page 1.3 to 2.1.

Press ctrl 2 4 to insert a new problem.

Press 2 to open a Graph page. To copy press ctrl \blacktriangle to go to the Page Sorter. See Figure 24.

With the border around page 1.3 press ctrl C .

Press \blacktriangledown \blacktriangledown so the border is around page 2.1.

Press ctrl V to paste page into problem 2.

Place border around 2.1 and press clear . Follow this procedure to copy 1.3 to 3.1.

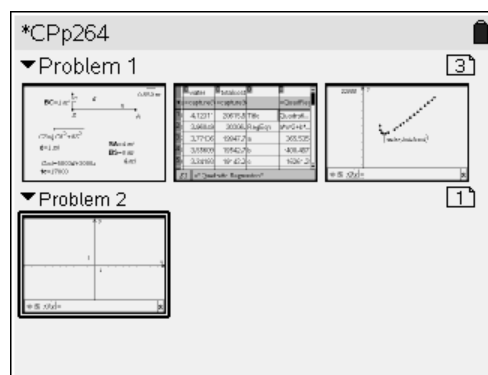

Figure 24

22. Find a quadratic function that best fits this data.

To change the Graph Type from Scatter Plot to Function press menu 3 1 . Press ctrl \blacktriangleleft to return to the Lists and Spreadsheet page.

Place your \blacktriangleright in column D. Press menu 4 1 6 to get a Quadratic Regression. See Figure 25.

Press \blacktriangledown to “water” and enter . Press tab \blacktriangledown to “totalcost” and enter . Press enter to get your Regression Model. See Figure 26 on the next page.

Press ctrl \blacktriangleright to return to graph.

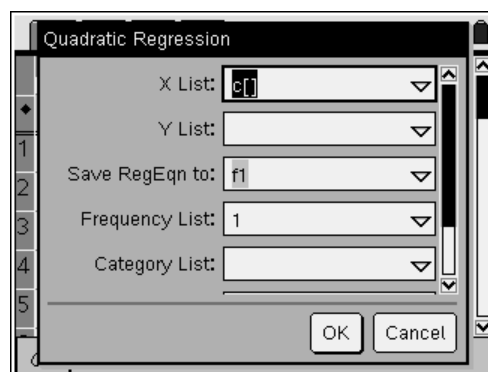

Figure 25

	1.1	1.2	1.3	2.1	RAD AUTO REAL

Figure 26

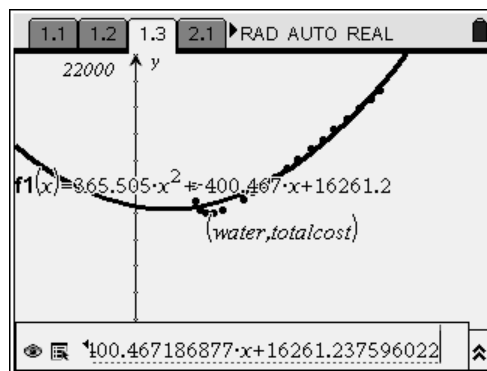

Figure 27

Press \blacktriangle and enter to see the graph of the quadratic model. See Figure 27.

23. Since I cannot trace on a Regression Model type

$\text{3} \text{ } \text{6} \text{ } \text{6} \text{ } \text{X} \text{ } \text{2} \text{ } \text{4} \text{ } \text{0} \text{ } \text{0} \text{ } \text{X} \text{ } \text{1} \text{ } \text{6} \text{ } \text{2} \text{ } \text{6} \text{ } \text{1}$

into problem 2.1 as $f1(x)$ and enter . Press

$\text{menu} \text{ } \text{5} \text{ } \text{1}$ to trace and approximate the

minimum value. See Figure 28. This is an

unreasonable answer since it is 1 mile to shore.

Therefore we will grab our graph near the vertex and move the parabola until the vertex is near

the lowest point of the stat graph. Also grab the parabola near the top of the screen and work for

a better fit. Find the minimum point now.

See Figure 29.

Note: The x value of the ordered pair represents the distance traveled by water. When solved,

the value for x is 3.43 which is over by 0.18 mi

while the minimum value is under by \$0.80.

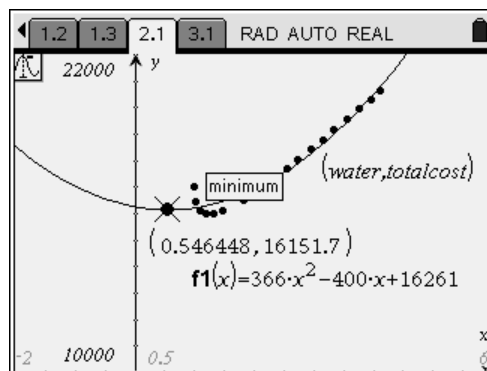

Figure 28

Figure 29

24. Write an equation for total cost in terms of x to find the actual minimum value.

The equation is $tc = 5000\sqrt{1 + (4-x)^2} + 3000x$.

Insert a new problem (Problem 3).

On page 3.1 press $\text{menu} \text{ } \text{2}$ to get a Graphs and

Geometry Page. Use the same window as in

Step 20 and type the equation into $f1(x)$

and enter . Find the minimum value of this

function by pressing $\text{menu} \text{ } \text{5} \text{ } \text{1}$ and trace until

the minimum appears. See Figure 30.

Figure 30
