MODELING DATA The *correlation coefficient r* for a set of paired data measures how well the best-fitting line fits the data. You can use a graphing calculator to find a value for *r*.

۲

For *r* close to 1, the data have a strong positive correlation. For *r* close to -1, the data have a strong negative correlation. For *r* close to 0, the data have relatively no correlation.

EXAMPLE 2 Find the best-fitting line

Find an equation of the best-fitting line for the scatter plot from Example 1. Determine the correlation coefficient of the data. Graph the best-fitting line.

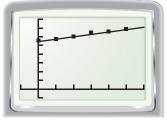

STEP 1 Perform regression

Press **STAT**. From the CALC menu, choose LinReg(ax+b). The *a*- and *b*-values given are for an equation of the form y = ax + b. Rounding these values gives the equation y = 1.36x + 27.7. Because *r* is close to 1, the data have a strong positive correlation.

STEP 2 Draw the best-fitting line

Press Y = and enter 1.36x + 27.7 for y_1 . Press GRAPH.

PRACTICE

In Exercises 1–5, refer to the table, which shows the total sales from men's clothing stores in the United States from 1997 to 2002.

| Year | 1997 | 1998 | 1999 | 2000 | 2001 | 2002 |
|-----------------------------|------|------|------|------|------|------|
| Sales (billions of dollars) | 10.1 | 10.6 | 10.5 | 10.8 | 10.3 | 9.9 |

- 1. Make a scatter plot of the data. *Describe* the correlation.
- 2. Find the equation of the best-fitting line for the data.
- 3. Draw the best-fitting line for the data.

DRAW CONCLUSIONS

- **4.** What does the value of *r* for the equation in Exercise 2 tell you about the correlation of the data?
- **5. PREDICT** How could you use the best-fitting line to predict future sales of men's clothing? *Explain* your answer.
