Graphs of the OTHER Trig Functions

MATH NSPIRED

Math Objectives

- Students will be able to identify the values of cotangent, secant and cosecant for various values of θ from the unit circle.
- Students will understand the correspondence of the graphs of cotangent, secant and cosecant to the unit circle.
- Students will be able to identify and explain features of the graphs of cotangent, secant, and cosecant, particularly locations where the functions are undefined, or where they have intercepts.

Vocabulary

- Sine
- Cosine
- Cotangent
- Secant
- Cosecant
- Unit circle

About the Lesson

- This lesson provides opportunities for students to explore and make sense of the graphs of the cotangent, secant, and cosecant functions.
- Students use clickers to move a point around the unit circle, observing the changes in function values for cotangent, secant, and cosecant, and observing the connections to the graphs of each of the three functions.
- The lesson provides opportunities to make and test conjectures about the graphs of the cotangent, secant, and cosecant functions based on observations from the unit circle.

TI-Nspire[™] Navigator[™] System

- Use Quick Poll to assess student understanding
- Use Screen Capture to display correspondences between graphs of sine and cosine and each of the three trigonometric functions featured in this activity.

Discussion Points and Possible Answers

Tech Tip: Click the sliders to change the value of θ and move the point around the unit circle.

Move to page 1.3.

- The screen shows a unit circle, and you can use the clicker to move a point around the circle, changing the angle θ. Change the angle θ to be equal to 35°, as pictured on the right. This creates two triangles: The one on the top with one leg on the y-axis, one leg the bolded line, and the one on the bottom with one leg on the x-axis and one leg the dashed line.
 - a. Prove that these are similar triangles.

<u>Answer:</u> Let the angle adjacent to θ in the interior of the upper triangle be α . Then $\alpha + \theta = 90^{\circ}$. But this means the other angle in the upper triangle must be the same in measure as θ . Thus we have two right triangles with one angle measuring θ , and therefore the triangles are similar by AA similarity.

b. Using the ratios of the non-hypotenuse side lengths, determine the length of the bolded side in terms of the other legs. Don't forget that you are working on a unit circle!

<u>Answer:</u> Let the horizontal and vertical sides of the lower triangle be a and b, respectively. Let the horizontal and vertical sides of the upper triangle be c and d, respectively. Then, by similarity of the two triangles, we have $\frac{c}{d} = \frac{a}{b}$. Then the bolded side of the upper triangle, its horizontal leg is $c = d \cdot \frac{a}{b}$. But the vertical leg, d is a radius of the unit circle, so

d = 1. Thus $c = \frac{a}{b}$.

TI-Nspire Navigator Opportunity: *Quick Poll* See Note 1 at the end of this lesson.

Teacher Tip: Making this connection is critical, and may require additional discussion. Students must understand that the bold line is equal in length to the ratio a/b. This is the reciprocal of the value of the tangent of θ , or the cotangent of θ . It will be important that you discuss this until students make the important connection. Similarly, on each of the secant and cosecant, you should check in with students to ensure that they understand WHY the bold line in each case represents the value of that trigonometric function at the given angle.

- 2. The screen shows a unit circle, and you can use the clicker to move a point around the circle, changing the angle θ .
 - a. Recall that we can write the trig functions in terms of the sine and cosine functions. What is the cotangent function in terms of the sine and cosine functions?

Answer:
$$\cot \theta = \frac{\cos \theta}{\sin \theta}$$
.

Teacher Tip: Be prepared to address sloppy notation. Cotangent, sine, and cosine are all functions, requiring arguments. Therefore, the response $\cot = \frac{\cos}{\sin}$ is incorrect.

- b. Click to move the point around the circle. What does the bold line represent? How is it determined? How do you know?
- **<u>Answer:</u>** The length of the bold line is the value of $\cot \theta$ at that value of θ . It is determined from $\frac{\cos \theta}{\sin \theta}$. We know this from question 1: The bold line is the ratio a/b, which is the reciprocal of the tangent of θ , or the cotangent of θ .
- c. For what values of θ is the cotangent 0? Undefined? How can you verify this?

<u>Answer:</u> $\cot \theta = 0$ when $\cos \theta = 0$, thus for $\theta = 180k + 90$. $\cot \theta$ is undefined when $\sin \theta = 0$, thus for $\theta = 180k$.

TI-Nspire Navigator Opportunity: Quick Poll See Note 2 at the end of this lesson.

d. Describe or sketch what you think the graph of the cotangent function might look like. Explain your thinking.

Sample Answer: The cotangent function will be very large near 0°, 0 at 90°, and a very large negative value close to 180°. It is periodic.

Move to page 2.2

- 3. The left hand side of the screen shows the unit circle from page 1.3 and the right side shows the graph of the cotangent function.
 - a. How does the graph of the cotangent function compare to your description in question 1? If your prediction was incorrect, what do you think was your mistake?

b. What happens as you click the arrow to change the value of θ ? Why does the graph "jump" from one piece to another?

Answer: The point moves along the graph of the cotangent. It "jumps" when the value of the cotangent is undefined.

c. Why does the graph repeat itself? How many times do you think this will happen? Why?

Answer: The graph repeats itself because the cotangent function is periodic. It will continue infinitely because the domain of the cotangent function is infinite

Teacher Tip: It is important to note that, while the screen only shows 2.5 periods of the function, it is defined beyond that.

- b. Click to move the point around the circle. What does the bold line represent? How is it determined?
- **<u>Answer:</u>** The length of the bold line is the value of $\sec \theta$ at that value of θ . It is determined from $\frac{1}{\cos \theta}$. We know this from using similar triangles, and observing that the the length of the bolded line is 1/a, where a is the length of the horizontal leg of the inner triangle, or $\frac{1}{\cos \theta}$.
- c. For what values of θ is the secant 0? Undefined? How can you verify this?
- **<u>Answer:</u>** sec θ is never 0, since it is impossible for a fraction with numerator 1 to be 0. sec θ will never be smaller in magnitude than 1, as 1 is the maximum magnitude of $\cos \theta$. It is undefined at 180k + 90°, as this is where $\cos \theta$ is 0.
- d. Describe or sketch what you think the graph of the secant function might look like. Explain your thinking.
- **Sample Answers:** The secant function will be undefined at 180k+90°, will attain minima of 1 at 360k°, and will attain maxima of -1 at 180(2k+1)°.

Move to Page 4.2.

 The left hand side of the screen shows the unit circle from page 3.2 and the right side shows the graph of the secant function.

 a. How does the graph of the secant function compare to your description in question 3? If your prediction was incorrect, what do you think was your mistake?

Sample Answers: Students may have incorrectly predicted the concavity of the graph or the extrema.

b. What happens as you click the arrow to change the value of θ? Why does the graph "jump" from one piece to another? Why doesn't the graph ever cross the *x*-axis?

Answer: The point traces on the graph of the function as well. It "jumps" because there are places where the function is undefined. The graph never crosses the *x*-axis because the function is never 0.

Move to Page 5.2.

6. a. How can you write the cosecant function in terms of the sine and cosine functions?

Answer:
$$\csc \theta = \frac{1}{\sin \theta}$$

b. Click to move the point around the circle. What does the bold line represent? How is it determined?

<u>Answer:</u> The length of the bold line is the value of $\csc \theta$ at that value of θ . It is determined from $\frac{1}{\sin \theta}$. We know this by reasoning through similar triangles again. The length of the bolded line is equal to 1/b where b is the length of the vertical leg of

the lower triangle. Of course, $b = \sin \theta$, as we are working in a unit circle.

c. For what values of θ is the cosecant 0? Undefined? How can you verify this?

Answer: $\csc \theta$ is never 0, since it is impossible for a fraction with numerator 1 to be 0.

Graphs of the OTHER Trig Functions

 $\csc\theta$ will never be smaller in magnitude than 1, as 1 is the maximum magnitude of $\sin\theta$. It is undefined at 180k°, as this is where $\sin\theta$ is 0.

d. Describe or sketch what you think the graph of the cosecant function might look like. Explain your thinking.

<u>Answer:</u> The cosecant function will be undefined at $180k^{\circ}$, will attain minima of 1 at $360k + 90^{\circ}$, and will attain maxima of -1 at $180(2k+1) + 90^{\circ}$.

Move to Page 6.2.

 How does the graph of the cosecant function compare to your description in question 5? Explain.

Sample Answer: Students may have incorrectly predicted the concavity of the function, or may have failed to correctly predict the extrema.

8. Choose one of the three trig functions from this activity. How could you use the graphs of sine and cosine to graph that function? Explain.

Sample Answer: Plotting the sine, cosine, and cotangent functions together, students may be able to identify the intersection points of sine and cosine as the places where the cotangent is 1, the zeroes of sine as the places where the cotangent is 0, and the zeroes of cosine as the places where the cotangent is undefined.

TI-Nspire Navigator Opportunity: *Screen Capture* See Note 3 at the end of this lesson.

Wrap Up

Upon completion of the lesson, the teacher should ensure that students understand:

- The relationships between the sine and cosine functions and each of the cotangent, secant, and cosecant functions.
- The correspondences between the unit circle and the graphs of each of the cotangent, secant, and cosecant functions.

TI-Nspire Navigator

Note 1

Question 1b, Quick Poll: Use the quick poll to determine students' understanding of the length of the bolded line in terms of the sides of the original triangle. This is a critical step to making sense of the use of the graphical representation as the activity progresses.

Note 2

Question 2c, Quick Poll: Use the quick poll to determine students' understanding of the places where cotangent is 0 or undefined. This is an opportunity to introduce generalization (i.e. beyond [-180, 180]) and to ensure that students are correctly identifying these values.

Note 3

Question 8, Screen Capture: Students may open a new graph page and plot sine, cosine, and the other trig function of their choice. Sharing these graphs provides an opportunity to discuss the correspondences between the three graphs, with particular focus on zeroes, extrema, and locations where the functions are undefined.

Extension

Teachers may wish to have students explore the results of a phase shift, vertical shift, or a change in amplitude in sine and cosine on the remaining trigonometric functions.

Teachers may wish to have students explore using the sine, cosine, or tangent functions to determine the graphs of cosecant, secant, and cotangent, respectively.
