Student

## Introduction

An equation that describes the relationship between two variables such as $x$ and $y$ can be visualised on the Cartesian plane. Equations involving three variables such as $x, y$ and $z$ can be described in three dimensions. Each of the three variable equations in this activity produces a plane, a flat surface. Solving simultaneous equations of three variables can be thought of as finding where all three flat surfaces intersect. This may sound complicated, it's not, it is a simple extension of solving simultaneous equations in two dimensions.

The TI-Nspire file 3D Equations contains sets of three equations. Your task is to find where the three planes intersect for each equation set.

## Instructions

Open the TI-nspire file: 3D Equations
On page 1.1, use the slider to select the first equation set.
Equation 1: $3 x+2 y+z=4$
Equation 2: $2 x-y-3 z=11$
Equation 3: $x-3 y+2 z=7$
Make sure the equations in your document match those shown above.
Navigate to page 1.2. All three equations are displayed in three dimensions. There are several controls that help to visualise and manipulate the view of these three planes, explore them!

## Keyboard Commands:

$x \quad x$ axis oriented out of the page.
$y \quad y$ axis oriented out of the page.
$z \quad z$ axis oriented out of the page.
$0 \quad$ default orientation (Letter ' 0 ')
$\times \& \div$ zoom in and zoom out
$a \quad$ Auto rotation
Grab and move is also available to rotate graphs.
To grab, click in a white space then press CTRL followed by a centre click on the touchpad. Swipe your finger left / right / up / down on the touchpad. The rotation is slightly delayed depending on the resolution used to generate the 3D image. Press ESC to release the grab feature.

## Note:

Use the slider (bottom left) to toggle between different graph combinations. Displaying just two graphs at a time can help gain an understanding of how two planes intersect.

The 3D graph can provide an approximate indication of the point of intersection, the solution to the set of simultaneous equations.

Drag the axis around to get a sense of where the three planes intersect for Equation Set 1. The best viewing angle depends on the equation set. For this set of equations the ' $y$ ' view provides an indication for both the $x$ and $z$ values. (Shown opposite). The planes appear to intersect in what might be described as quadrant four in the $x-z$ plane.

Question: 1. Explore the 3D representation of the Equation Set 1 and determine the nature of the point of intersection as follows. (Note: It is the positive end of each axis that is labelled.) x coordinate: positive or negative?
y coordinate: positive or negative? z coordinate: positive or negative?

Navigate to page 1.3. The aim here is to remove one of the variables. For this page focus on removing 'y' using the two equations. (1 \& 2)

Note: If the equations are not displayed, press $\mathrm{Ctrl}+\mathrm{A}$ (select all) then choose Evaluate from the Actions menu.

Decide whether equation 1 and 2 need to be added or subtracted. The top slider selects Add / Subtract.

The next task is to determine how much to multiply equation 1,2 or both by in order to eliminate y. If you're not sure, try clicking a couple of times,
 the equations update so too the combination of the equations at the base of the screen. When the equation at the base of the screen doesn't include ' $y$ ', then you have achieved your goal. This new equation will be called: Equation 4.

Question: 2. Write down your equation 4.
Question: 3. Transpose your equation to make z the subject.
Navigate to page 1.2. Use the slider to display equations 1 and 2 only.
Use the TAB key to navigate to the $z$ entry line and type in your new equation. (Question 3) The new equation will appear as a 'wire lattice' to make it easy to identify. (See opposite).

Experiment with the view to see how your new equation interacts and intersects with equations 1 and 2.

Once you have finished exploring, switch your equation off or delete it from the $z$ entry line.

Question: 4. Explain how and where your new equation interacts with equations 1 and 2.

Navigate to page 1.4. The aim here is to remove one of the variables. The variable to be removed must be the same as for the previous page. For this page focus on removing 'y' using the two equations. ( $2 \& 3$ )

Decide whether equation 2 and 3 need to be added or subtracted. The top slider selects Add / Subtract.

The next task is to determine how much to multiply equation 2,3 or both by in order to eliminate y. This new equation will be called: Equation 5.

Question: 5. Write down your equation 5 .
Question: 6. Transpose the equation to make $z$ the subject.
Question: 7. Graph your new equation on Page 1.2 whilst displaying equations 2 and 3 . What do you notice?
Navigate to page 1.5. If you have successfully completed pages 1.3 and 1.4, eliminating the same variable from each pair to create equations 4 and 5 , you should see two equations here with two variables!

Your aim here is to remove one of the variables leaving a single equation with just one variable, as shown opposite.

The coefficients on each equation have been blurred on purpose!

Question: 8. Write down your final equation (one variable) and determine the corresponding value for this variable.
Question: 9. Use equation 4 and your answer to question 8 to determine the corresponding second variable.
Question: 10. Return to page 1.1 and use equation 1 to determine the final variable.
Question: 11. Write down the coordinates $(x, y, z)$ for the point where the three planes intersect. Compare the values with your answer to question 1 .
Question: 12. Verify your results by substituting the values into equations 2 and 3.
Navigate to page 1.1. Use the slider to generate equation set 2.
Navigate to page 1.2 and estimate the nature of $\mathrm{x}, \mathrm{y}$ and z .
(positive or negative)
Use the environments on pages 1.3, 1.4 and 1.5 to determine the where these three equations intersect.
Remember you can check equations 4 and 5 using the graph on page 1.2

Question: 13. Determine solutions to each of the four remaining equation sets.
Try eliminating the variables in a different order; remember however, the same variable must be removed from equation sets on pages 1.3 and 1.4.

## Technology

Press Ctrl + Up to see all the pages and problems in the current document. Navigate to the required page using the navigation pad then press enter.
