# String Graphs – Part 1

## **Student Activity**

# (C)

7 8 9 10 **11** 12

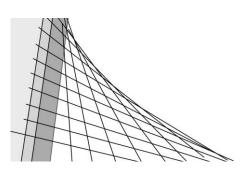

## Aims

- Determine a series of equations of straight lines to form a pattern similar to that formed by the cables on the Jerusalem Chords Bridge.
- Determine the parametric equation for the curve created by the successive intersection points.

# **Determining Equations**

Start a new document and insert a Graph application.

Use the [Menu] to adjust the window settings: Window/Zoom > Quadrant 1.

A series of straight line graphs will be constructed to form a string pattern similar to that on the Chords bridge.

The first straight line graph passes through the points:

(0,10) & (1,0)

The result is shown opposite. Use the questions to help determine the equation for this line and all subsequent lines.

The equation to any straight line can be expressed in the form: y = mx + c  $m = \text{gradient} = \frac{rise}{run}$ c = y-axis intercept

## Question: 1.

Determine the equation of this first line, passing through the points: (0, 10) & (1, 0)

- a) Write down the y-axis intercept of the first line.
- b) Calculate the gradient of the first line.
- c) Write down the equation of the first line and graph it on the calculator.

Once the first line is completed, try the second line.

The second straight line graph passes through the points:

(0,9) & (2,0)

As more graphs are added it may be desirable to remove the equation labels.

## Question: 2.

Determine the equation of the line, passing through the points: (0, 9) & (2, 0).

## Question: 3.

Determine the gradient and y – intercept for the remaining straight lines in this family of lines. Record your results using exact values. Graph all 10 equations on the same set of axis.

Eqn. No.	Point 1	Point 2	Gradient	y-Intercept	Equation
1	(0, 10)	(1, 0)			
2	(0, 9)	(2, 0)			
3	(0, 8)	(3, 0)			
4	(0, 7)	(4, 0)			
5	(0, 6)	(5, 0)			
6	(0, 5)	(6, 0)			
7	(0, 4)	(7, 0)			
8	(0, 3)	(8, 0)			
9	(0, 2)	(9, 0)			
10	(0, 1)	(10, 0)			

A single equation can be determined to graph all 10 equations by using a parameter (t) for the equation number. Study each of your equations above and compare with the equation 'number'.

## Question: 4.

The general equation is of the form:  $y = \frac{a}{b}x + c$  where *a*, *b* and *c* are expressions in terms of *t*.

- a) Determine an expression for *a* in terms of *t*.
- b) Determine an expression for *b* in terms of *t*.
- c) Determine an expression for *c* in terms of *t*.
- d) Write down the general equation for the family of straight lines. Verify your equation by substituting a range of values for *t* and comparing with the corresponding original equation.

```
Insert a Calculator application and define t as the set of integers: {1, 2, 3, 4, 5, 6, 7, 8, 9, 10}
```

Define your general equation in terms of the variable *x* and parameter *t*.

Return to the Graph application and graph your function:

f(x,t)

## 

## Question: 5.

Describe the shape of the curve formed by the family of straight lines.

Graph the following extended family of straight lines: f(x,t), f(x,t+10) and f(x,t-10). To see the full effect, zoom out using the zoom out tool in the Window / Zoom menu and place the magnifying glass close to the centre of the screen.

## **Question: 6.**

Describe the shape of the curve formed by the extended family of straight lines.

## **Finding a Locus**

The points of intersection between successive equations can be used to produce the curve where infinitely many straight lines are generated.<sup>1</sup>

## Question: 7.

Show that the first two lines passing through (0, 10) & (1, 0) and (0, 9) & (2, 0) intersect when:

$$x = \frac{2}{11}$$
 and  $y = \frac{90}{11}$ .

#### Question: 8.

Use simultaneous equations to determine the next point of intersection, between equations 2 and 3.

## Question: 9.

Use CAS to determine the point of intersection between f(x,3) and f(x,4).

<sup>©</sup> Texas Instruments 2017. You may copy, communicate and modify this material for non-commercial educational purposes provided all Author: P. Fox acknowledgements associated with this material are maintained.

<sup>&</sup>lt;sup>1</sup> The original curve or envelope would be tangent to the straight line equations, as the number of lines over the interval is increased successive points of intersection would come closer and closer to the curve.

## Question: 10.

Complete the table below for the points of intersection between successive lines.

## Question: 11.

Use the difference table to help identify the nature of the pattern in the x coordinates. Based on the results determine an equation in terms of the equation number t.

**Note**: When t = 1 this will be the point of intersection between equations 1 and 2. When t = 2, this will be the point of intersection between equations 2 and 3.

Eqn. Nos.	Point of Intersection
1 & 2	
2 & 3	
3 & 4	
4 & 5	
5&6	
6 & 7	
7&8	
8 & 9	
9 & 10	

x-Coordinate	$\Delta_1$	Δ <sub>2</sub>

## Question: 12.

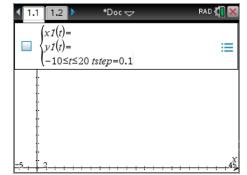

Explain the CAS instruction<sup>2</sup>: solve (f(x,t) = f(x,t+1), x)

## Question: 13.

Determine the equation for the y coordinate of the successive points of intersection.

## Question: 14.

On the Graph application, change the graph type to parametric and use the equations from Question 12 for the *x* coordinate and Question 13 for the *y* coordinate. Change the step size to 0.1 and the domain for *t*:  $-10 \le t \le 20$ . Window settings include x-min = -5, x-max = 50, y-min = -5 and y-max = 35.

<sup>&</sup>lt;sup>2</sup> To test this command the list t must be deleted. The delete variable command is in the Actions menu: DelVar t

## **Extension - Polynomials**

## Question: 15.

A polynomial is an expression containing the summation of one or more variables with integer powers and corresponding coefficients.

- a. Use the parametric equations to write a polynomial involving *x* and *y* for the curve produced by the points of intersection.
- b. Use a selection of appropriate points to show that your equation is an accurate representation of the curve created by the points of intersection of consecutive lines.
- c. Show that the derived continuous equation it not an accurate representation of the limiting case where infinitely many lines would form a smooth curve.
