

Read This First

The programs in this folder are intended to

- * Be easily understood even by folks who are relatively new to coding
- * Be used as building blocks to extend for use with additional devices like motors, etc.

You are encouraged to modify the programs to prompt the TI-Innovator Hub to do something with the data – control the LED color, play a sound, etc.

Gas Pressure Sensors (GPS): There are two types of Vernier GPSs; the TI-84 CE program included in this folder works correctly with the sensor that does not have the model number printed on the front label; the other model will require additional calibration.

Use of the SensorLink requires sketch v1.3 on your TI-Innovator™ Hub. In order to update the sketch, you will need to download and install TI-Innovator™ Hub Update Software to your computer.
