What's New

What's New in CE TI-Basic Programming Guide for the TI CE Family of Graphing Calculator v5.3

Programing Guide Menu Changes:

All items in this list are new or updated entries in the CE TI-Basic Programming Guide for the TI CE Graphing Calculator v5.3.

Editing Features

 New editing features have been added to the Program Editor. These include undo, insert, and cut/copy/paste. Press prgm to EDIT your program. Pressing alpha [f5] opens the new editing MENU.

Executing a Program

• Programs can now be executed from RAM or Archive.

Running an Assembly Language Program

• CE OS 5.3 and later the Asm(command is optional.

Introduction to CE TI-Basic Programming on your TI CE Family of Graphing Calculators

You can use TI-Basic to create a program on your graphing calculator. You can create a program that will calculate a desired output or control an experience, such as a game.

What Is a Program?

A program is a set of one or more command lines, each containing one or more instructions. When you execute a program, the TI CE graphing calculator performs each instruction on each command line in the same order in which you entered them. The number and size of programs that the TI 84 Plus CE can store is limited only by available memory.

To create a program, simply enter command lines using the Program Editor. The program will run from the Home Screen. Use this guide to learn how to create, edit, and delete programs.

Tip: Use Catalog Help by pressing [+] on most commands to help you fill in the correct arguments for the commands before you paste them into the Program Editor.

As you progress in programming, a TI-Basic Program Editor is also available in TI Connect™ CE software. You can use the Program Editor workspace in TI Connect™ CE to create programs, to send programs to a connected calculator via USB, to test your programs, and to save programs to your computer. The Program Editor workspace in TI Connect™ CE allows copy, cut, paste, and undo commands.

Note: The Program Editor on the calculator does not contain editing features such as copy, cut, paste, or undo. When on the calculator, remember you cannot undo a [clear] or [del].

Getting Started Activity:

Programming the Formula to find the Volume of a Cylinder given Radius and Height

Given the Radius and Height of a cylinder, you can compute the Volume using this formula. This activity allows you to write a program to prompt for the values of the Radius and Height of a cylinder so that you can then compute the Volume.

The formula for the volume of a cylinder is

 $V = \pi R^2 H$ cubic units

Where

V = Volume

R = Radius of the base

H = Height of the cylinder

This program could be useful for a variety of activities such as:

- Providing a table with many values of Radius and Height and having students fill out the Volume column
- Running a program to fill in the values for Volume in the table

Some questions to investigate:

- (If formula is unknown to the student), what pattern do you see in the Volume numbers to make a good guess at the formula?
- What is the largest Volume found?
- How much does the Volume increase if the Height increases by one unit?
- How much does the Volume increase if the Radius increases by one unit?

Running a program repeatedly as a tool allows quick analysis for higher-level thinking problems.

Creating a NEW Program

1. Press PRGM \(\big)\) to display the PRGM NEW menu.

Naming the Program

Press ENTER to select 1:Create New. 1.

The Name= prompt is displayed, and [2nd] [A-lock] (alpha-lock) is on.

Tip: The alpha characters are upper right above keys on the keypad and are pasted when [alpha] or [2nd] [A-lock] is pressed before pressing the primary key.

Press CYLINDER, and then press [ENTER] to name the program CYLINDER.

Tip: Program names can have a maximum of eight characters. First character must be a letter. Notice the checkerboard cursor on the screen when the maximum is reached.

3. Press ENTER and you are now in the program editor.

> The colon (:) in the first column of the second line indicates the beginning of a command line.

Note: On the calculator, the command lines are not numbered as when using

TI Connect™ CE Program Editor.

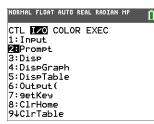

Entering Commands

Whoever uses your program will have to input the Radius and Height values. You will use the **Prompt** command.

- Press PRGM ► to access the I/O (Input/Output) command menu.
- Press
 ▼ to highlight the Prompt command.

Note: For this example, you will use the Catalog Help feature to illustrate this built-in argument syntax help in the calculator. If you already know the arguments for a command, you can select a menu item and paste them to the Program Editor without using Catalog Help.

- The Prompt menu item number is highlighted so press
 . Use the Catalog Help syntax editor (if needed). The syntax for the arguments of Prompt is shown below the editing line as variables separated by commas. Anything within a square bracket [] is an optional argument, so Prompt needs at least one variable name.
- 4. Press alpha R, alpha H to enter the variable names for Radius and Height.
- Press [PASTE] (<u>Itrace</u>) to paste the command with the arguments back to the Program Editor. Press [ESC] ([graph]) to return to the last cursor location without pasting.
- Back on the Program Editor, press
 enter
 to move the cursor to the next
 command line

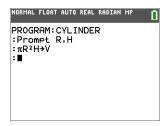

Store the formula for the volume of a cvlinder:

7. To enter the expression $[\pi]$ \mathbb{R}^2 H and store value to the variable V. press 2nd $[\pi]$ alpha $\mathbf{R}[\mathbf{x}^2]$ alpha $\mathbf{H}[\mathsf{sto}]$ alpha V enter.

Displaying the Calculated Volume.

Create a command line to display the calculated volume:

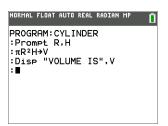

1. Press prgm > 3 to select 3:Disp from the PRGM I/O menu.

Disp is pasted to the command line.

Tip: Remember you can press [+] on most commands to use the Catalog Help syntax editor to see the correct arguments for commands.

2. Press [2nd] [A-lock] ["] **VOLUME IS** ["] alpha, alpha V enter

> This will display the text **VOLUME IS** on one line and the calculated value of V on the next line of the Home Screen when you run the program.

Running a Program

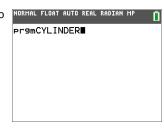

Your program is complete! Now run the program from the Home Screen.

- 1. Press [2nd] [quit] to display the Home
- Press prgm to display the **PRGM EXEC** 2. menu.

The items on this menu are the names of stored programs.

3. Press enter to paste prgm CYLINDER to the current cursor location. (If CYLINDER is not item 1 on your PRGM EXEC menu, move the cursor to **CYLINDER** before you press [enter].)

Finding the Volume

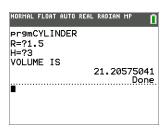

To find the volume of the cylinder with Radius 1.5 cm and Height 3 cm, complete the following steps.

- 1. Press enter to execute (run) the program.
- 2. When prompted for R, enter 1.5 and press enter
- 3. When prompted for **H**, enter **3** and press enter.

The text **VOLUME IS**, the value of **V**, and **Done** are displayed.

The volume of the cylinder is displayed to 8 decimal places as 21. 20575041 cubic cm.

4. At this point, to rerun the program, press enter and repeat for different values of R and H.

Creating and Deleting Programs

This section describes how to create programs, and how to delete programs.

Operating Systems Versions and Programming

- Programs created using the TI-84 Plus OS 2.55MP and earlier or the TI-83 Plus 1.19
 OS or earlier will run on the TI-84 Plus CE; however, they may result in unexpected
 displays on the TI-84 Plus CE given the high resolution screen. You should test your
 existing programs on the TI-84 Plus CE and adjust command arguments as needed.
 In particular, any commands that display on the graph need to have the arguments
 adjusted to the desired pixel locations on the graph area. Programs displaying to
 the Home Screen should run as expected.
- Programs can run in Classic or MathPrint™ mode.
- Shortcut menus are available wherever the MATH menu can be accessed.
- MathPrint™ templates are not available for programs. All input and output is in Classic format.
- You can use fractions in programs, but you should test the program to make sure that you get the desired results.
- The spacing of the display may be slightly different in MathPrint™ mode than in Classic mode. If you prefer the spacing in Classic mode, set the mode using a command in your program. Screen shots for the examples in this chapter were taken in MathPrint™ mode.
- Syntax help is built in on the TI-84 Plus CE. When in program edit mode, press

Note: Press \boxdot when a command is highlighted in a menu to use the syntax help for your programming.

Creating a New Program

To create a new program, follow these steps.

1. Press PRGM \(\bullet\) to display the **PRGM NEW** menu.

- Press ENTER to select 1:Create New. The Name= prompt is displayed, and alphalock is on.
- 3. Press a letter from A to Z or θ to enter the first character of the new program name.

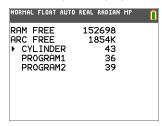

Note: A program name can be one to eight characters long. The first character must be a letter from A to Z or θ . The second through eighth characters can be letters, numbers, or θ .

- 4. Enter zero to seven letters, numbers, or θ to complete the new program name.
- 5. Press ENTER. The program editor is displayed.
- 6. Enter one or more program commands.
- 7. Press [2nd] [QUIT] to leave the program editor and return to the home screen.

Managing Memory and Deleting a Program

To check whether adequate memory is available for a program you want to enter:

- 1. Press [2nd] [MEM] to display the **MEMORY** menu.
- Select 2:Mem Management/Delete to display the MEMORY MANAGEMENT/DELETE menu.
- Select 7:Prgm to display the PRGM editor.

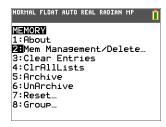

The TI CE family of graphing calculators expresses memory quantities in bytes.

Increase Available Memory

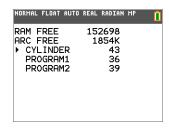

You can increase available memory in one of two ways. You can delete one or more programs or you can archive some programs.

To increase available memory by deleting a specific program:

 Press 2nd [MEM] and then select 2:Mem Management/Delete from the MEMORY menu.

2. Select 7:Prgm to display the program files.

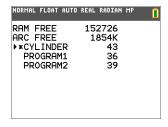

3. Press ♠ and ▶ ALPHA o move the selection cursor (▶) next to the program you want to delete, and then press DEL. The program is deleted from memory.

Note: You will receive a message asking you to confirm this delete action. Select 2:ves to continue.

To leave the **PRGM** editor screen without deleting anything, press [2nd] [QUIT], which displays the home screen.

To increase available memory by archiving a program:

- Press [2nd] [MEM] and then select 2:Mem Management/Delete from the MEMORY menu.
- 2. Select 2:Mem Management/Delete to display the MEMORY MANAGEMENT/DELETE menu.
- 3. Select 7:Prgm... to display the program files.

4. Press ENTER to archive the program. An asterisk will appear to the left of the program to indicate it is an archived program.

To unarchive a program in this screen, put the cursor next to the archived program and press [ENTER]. The asterisk will disappear.

Note: Archive programs cannot be edited or executed. In order to edit or execute an archived program, you must first unarchive it.

Entering Command Lines and Executing Programs

This section describes how to enter a command line and how to execute programs.

Entering a Program Command Line

You can enter on a command line any command, instruction, or expression that you could execute from the home screen. In the program editor, each new command line begins with a colon. To enter more than one instruction or expression on a single command line, separate each with a colon.

Note: A command line can be longer than the screen is wide.

While in the program editor, you can display and select from menus. You can return to the program editor from a menu in either of two ways.

•	Select a menu item,	which pastes	the item to the cur	rrent command line.
---	---------------------	--------------	---------------------	---------------------

— or —

Press CLEAR.

When you complete a command line, press [ENTER]. The cursor moves to the next command line.

Programs can access variables, lists, matrices, and strings saved in memory. If a program stores a new value to a variable, list, matrix, or string, the program changes the value in memory during execution.

You can call another program as a subroutine.

Executing a Program

To execute a program, begin on a blank line on the home screen and follow these steps.

- 1. Press PRGM to display the **PRGM EXEC** menu.
- 2. Select a program name from the **PRGM EXEC** menu. **prgm**name is pasted to the home screen (for example, prgmCYLINDER).
- 3. Press ENTER to execute the program. While the program is executing, the busy indicator is on.
 - Last Answer (Ans) is updated during program execution.
 - Last Entry is not updated as each command is executed.
 - The TI CE family of graphing calculators checks for errors during program execution.
 - There is no syntax checking as you enter a program in the program editor.

Note: CF OS 5.3 and later

- Programs can be executed from RAM or Archive. Programs cannot be edited if in
- Assembly programs will run from the Home Screen without the use of the Asm(command.
- Editing MENU ([alpha] [f5]) in the Program Editor
 - 1:Execute Program
 - The program being edited will execute directly from the program editor.
 - 7: Insert Comment Above (alpha f5 7)
 - **Insert Comment Above** pastes the quote " token at the start of a new command line above the current cursor location. When this command line is executed, a String variable of the comment text is created and is stored in the Ans variable. When planning out your program and use of variables, if comments are included using the quote " token, plan that the comment string will be stored to Ans upon execution.

Breaking a Program

To stop program execution, press [ON]. The **ERR:BREAK** menu is displayed.

- To return to the home screen, select 1:Quit.
- To go where the interruption occurred, select **2:Goto**.

Editing Programs

In this section you will follow steps to edit a program. This section describes how to insert and delete command line.

Editing a Program

To edit a stored program, follow these steps.

- Press PRGM > to display the **PRGM EDIT** menu.
- 2. Select a program name from the PRGM EDIT menu. Up to the first nine lines of the program are displayed.

Note: The program editor does not display a \downarrow to indicate that a program continues beyond the screen.

- Edit the program command lines.
 - Move the cursor to the appropriate location, and then delete, overwrite, or insert.
 - Press CLEAR to clear all program commands on the command line (the leading colon remains), and then enter a new program command.

Note: To move the cursor to the beginning of a command line, press 2nd ◀; to move to the end, press [2nd]]. To scroll the cursor down seven command lines, press [ALPHA] ▼. To scroll the cursor up seven command lines, press ALPHA ▲.

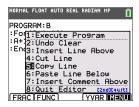

Inserting and Deleting Command Lines

To insert a new command line anywhere in the program, place the cursor where you want the new line, press [2nd] [INS], and then press [ENTER]. A colon indicates a new line.

To delete a command line, place the cursor on the line, press CLEAR to clear all instructions and expressions on the line, and then press DEL to delete the command line, including the colon.

Editing Feature for CE OS 5.3 and Later

Editing features have been added to the Program Editor. These include undo, insert, and cut/copy/paste. Press prgm to EDIT your program. Pressing alpha [f5] opens the new editing MENU.

Tip: MENU Item 7: Insert Comment Above (alpha) [f5] 7)

Insert Comment Above pastes the quote " token at the start of a new command line above the current cursor location. When this command line is executed, a String variable of the comment text is created and is stored in the Ans variable. When planning out your program and use of variables, if comments are included using the quote " token, plan that the comment string will be stored to Ans upon execution.

Copying and Renaming Programs

This section describes how to copy and rename a program, and how to scroll the menus.

Copying and Renaming a Program

To copy all command lines from one program into a new program, follow steps 1 through 4 for Creating a New Program, and then follow these steps.

- 1. Press [2nd] [RCL]. Rcl is displayed on the bottom line of the program editor in the new program.
- 2. Press PRGM to display the **PRGM EXEC** menu.
- 3. Select a name from the menu. prgmname is pasted to the bottom line of the program editor.
- 4. Press ENTER. All command lines from the selected program are copied into the new program.

Copying programs has at least two convenient applications.

- You can create a template for groups of instructions that you use frequently.
- You can rename a program by copying its contents into a new program.

Note: You also can copy all the command lines from one existing program to another existing program using RCL.

Scrolling the PRGM EXEC and PRGM EDIT Menus

The TI CE family of graphing calculators sort PRGM EXEC and PRGM EDIT menu items automatically into alphanumerical order. Each menu only labels the first 10 items using 1 through 9, then 0.

To jump to the first program name that begins with a particular alpha character or θ , press \overline{ALPHA} [letter from A to Z or θ].

Note: From the top of either the PRGM EXEC or PRGM EDIT menu, press A to move to the bottom. From the bottom, press \(\bar{\pi} \) to move to the top. To scroll the cursor down the menu seven items, press ALPHA . To scroll the cursor up the menu seven items, press ALPHA .

PRGM CTL (Control) Instructions

This section describes the PRGM CTL (Control) Instructions.

PRGM CTL Menu

To display the **PRGM CTL** (program control) menu, press <u>PRGM</u> from the program editor only.

Important Tip: To quickly find a command, use alpha ► or alpha ▼ to page through screens.

Description

Creates a conditional test.

2:	Then	Executes commands when If is true.
3:	Else	Executes commands when If is false.
4:	For(Creates an incrementing loop.
5:	While	Creates a conditional loop.
6:	Repeat	Creates a conditional loop.

1: If

7: Fnd Signifies the end of a block. 8: Pause Pauses program execution.

9: Ibl Defines a label. Goes to a label. 0: Goto

Wait Α: Suspends execution of a program for a given time.

B: IS>(Increments and skips if greater than. C: Decrements and skips if less than. DS< D: Menu(Defines menu items and branches. F: prgm Executes a program as a subroutine.

F: Return Returns from a subroutine.

G: Stop Stops execution.

H: DelVar Deletes a variable from within program. GraphStyle(1: Designates the graph style to be drawn. J: GraphColor(Designates the color of the graph to be drawn

K: Extends TI-Basic (not available) OpenLib(Extends TI-Basic (not available) 1: ExecLib(

Note: Press + when a command is highlighted in a menu to use the syntax help for your programming.

These menu items direct the flow of an executing program. They make it easy to repeat or skip a group of commands during program execution. When you select an item from the menu, the name is pasted to the cursor location on a command line in the program.

To return to the program editor without selecting an item, press [CLEAR].

Controlling Program Flow

Program control instructions tell the TI CE graphing calculator which command to execute next in a program. If, While, and Repeat check a defined condition to determine which command to execute next. Conditions frequently use relational or Boolean tests, as in:

If A<7:A+1→A or

If N=1 and M=1:Goto Z

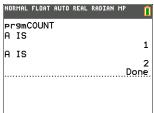

Use If for testing and branching. If *condition* is false (zero), then the *command* immediately following **If** is skipped. If *condition* is true (nonzero), then the next command is executed. If instructions can be nested.

:If condition :command (if true) :command

Program

Output

If-Then

Then following an If executes a group of commands if condition is true (nonzero). End identifies the end of the group of *commands*.

:If condition

:Then

:command (if true)

:command (if true)

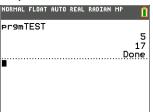

:End

:command

Program

Output

If-Then-Else

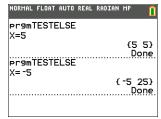

Else following **If-Then** executes a group of *commands* if *condition* is false (zero). **End** identifies the end of the group of *commands*.

```
:If condition
:Then
:command (if true)
:command (if true)
:Else
:command (if false)
:command (if false)
:End
:command
```

Program

Output

Note: Press ENTER to repeat the program.

For(

For(loops and increments. It increments *variable* from *begin* to *end* by *increment*. increment is optional (default is 1) and can be negative (end<begin). end is a maximum or minimum value not to be exceeded. **End** identifies the end of the loop. For(loops can be nested.

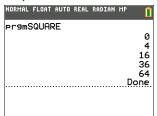

:For(variable,begin,end[,increment]) :command (while end not exceeded) :command (while end not exceeded) :End

:command

Program

Output

While

While performs a group of commands while condition is true. condition is frequently a relational test, condition is tested when **While** is encountered. If condition is true (nonzero), the program executes a group of commands. End signifies the end of the group. When condition is false (zero), the program executes each command following End. While instructions can be nested.

:While condition :command (while condition is true) :command (while condition is true) :End :command

Program

```
NORMAL FLOAT AUTO REAL RADIAN MP

PROGRAM:LOOP
:0>I
:0>J
:0+J
:While I<6
:J+1+J
:I+1+I
:End
:Disp "J=",J
:
```

Output

```
NORMAL FLOAT AUTO REAL RADIAN MP 
PROMLOOP

J= 6
Done.
```

Repeat

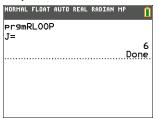

Repeat repeats a group of *commands* until *condition* is true (nonzero). It is similar to **While**, but *condition* is tested when **End** is encountered; therefore, the group of *commands* is always executed at least once. **Repeat** instructions can be nested.

- :Repeat condition
- :command (until condition is true)
- :command (until condition is true)
- :End
- :command

Program

Output

End

End identifies the end of a group of *commands*. You must include an **End** instruction at the end of each **For(, While,** or **Repeat** loop. Also, you must paste an **End** instruction at the end of each **If-Then** group and each **If-Then-Else** group.

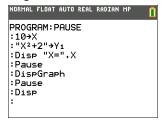

Pause

Pause suspends execution of the program so that you can see answers or graphs. During the pause, the pause indicator is on in the top-right corner.

- Pause without an argument temporarily pauses the program. If the DispGraph or **Disp** instruction has been executed, the appropriate screen is displayed. Press [ENTER] to resume execution.
- **Pause** with *value* displays *value* on the current home screen. *value* can be scrolled. Pause value. Press ENTER to resume execution.
- **Pause** with *value* and *time* displays value on the current home screen and execution of the program continues for the time period specified. For time only, use Pause "",time where the value is a blank string. Time is in seconds. Pause value.time.

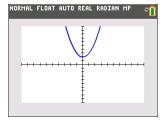

Note: When using TI Connect CE Program Editor, Pause must have a space after the command even if no argument is entered.

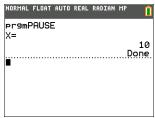

Program

Output

Lbl, Goto

Lbl

Lbl (label) and **Goto** (go to) are used together for branching.

LbI specifies the *label* for a command. *label* can be one or two characters (A through Z, 0 through 99, or θ).

Lbl label

Goto

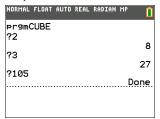

Goto causes the program to branch to label when **Goto** is encountered.

Goto label

Program

Output

Wait

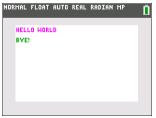

Wait suspends execution of a program for a given time. Maximum time is 100 seconds. During the wait time, the busy indicator is on in the top-right corner of the screen.

Wait time

Program

Output: "Bye!" displays after 5 seconds.

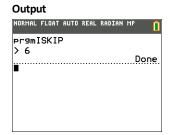

IS>(

IS>((increment and skip) adds 1 to *variable*. If the answer is > *value* (which can be an expression), the next *command* is skipped; if the answer is $\leq value$, the next *command* is executed, variable cannot be a system variable.

:IS>(variable,value) :command (if answer value) :command (if answer > value)

Program NORMAL FLOAT AUTO REAL RADIAN MP PROGRAM: ISKIP :7→A : IS>(A,6) :Disp "NOT > 6" :Disp "> 6"

Note: IS>(is not a looping instruction.

DS<

DS<((decrement and skip) subtracts 1 from *variable*. If the answer is < *value* (which can be an expression), the next *command* is skipped; if the answer is $\geq value$, the next command is executed. variable cannot be a system variable.

:DS<(variable, value) :command (if answer value) :command (if answer < value)

Program

Output

Note: DS<(is not a looping instruction.

Menu(

Menu(sets up branching within a program. If **Menu(** is encountered during program execution, the menu screen is displayed with the specified menu items, the pause indicator is on, and execution pauses until you select a menu item.

The menu title is enclosed in quotation marks ("). Up to nine pairs of menu items are allowed. Each pair comprises a text item (also enclosed in quotation marks) to be displayed as a menu selection, and a label item to which to branch if you select the corresponding menu selection.

Menu("title","text1",label1,"text2",label2, . . .)

Program

Output

The program above pauses until you select 1 or 2. If you select 2, for example, the menu disappears and the program continues execution at LbI B.

prgm

Use **prgm** to execute other programs as subroutines. When you select **prgm**, it is pasted to the cursor location. Enter characters to spell a program *name*. Using **prgm** is equivalent to selecting existing programs from the **PRGM EXEC** menu; however, it allows you to enter the name of a program that you have not yet created.

prgmname

Note: You cannot directly enter the subroutine name when using **RCL**. You must paste the name from the **PRGM EXEC** menu.

Return

Return quits the subroutine and returns execution to the calling program, even if encountered within nested loops. Any loops are ended. An implied **Return** exists at the end of any program that is called as a subroutine. Within the main program, **Return** stops execution and returns to the home screen.

Stop

Stop stops execution of a program and returns to the home screen. Stop is optional at the end of a program.

DelVar

DelVar deletes from memory the contents of *variable*.

DelVar variable

GraphStyle(

GraphStyle(designates the style of the graph to be drawn. function# is the number of the Y= function name in the current graphing mode. graphstyle is a number from 1 to 7 that corresponds to the graph style, as shown below.

```
1 = '\ (Thin)
                                           5 = (Path)
2 = " (Thick)
                                          6 = (Animate)
3 = ♥ (Shade above)
                                          7 = '. (Dot-Thick)
4 = L (Shade below)
                                          8 = '. (Dot-Thin)
```

GraphStyle(function#,graphstyle)

For example, **GraphStyle(1,5)** in **Func** mode sets the graph style for Y1 to ⁻⁽¹⁾ (path; 5).

Not all graph styles are available in all graphing modes.

GraphColor

GraphColor(designates the color of the graph to be drawn. function# is the number of the Y= function name in the current graphing mode. color# is a number from 10 to 24 that corresponds to the graph color, as shown in the table below:

Color Number	Color Name
10	BLUE

11	RED
12	BLACK

PRGM I/O (Input/Output) Instructions

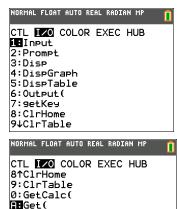

This section describes the **PRGM I/O** (Input/Output) Instructions.

PRGM I/O Menu

To display the **PRGM I/O** (program input/output) menu, press <u>PRGM</u> From within the program editor only.

B:Send(C:eval(D:expr(E:toString(F:String)Equ(

Important Tip: To quickly find a command, use alpha ► or alpha ▼ to page through screens.

CTRL	I/O	COLOR	EXEC	HUB

Description

		2 courpaion
1:	Input	Enters a value or uses the cursor.
2:	Prompt	Prompts for entry of variable values.
3:	Disp	Displays text, value, or the home screen.
4:	DispGraph	Displays the current graph.
5:	DispTable	Displays the current table.
6:	Output(Displays text at a specified position.
7:	getKey	Checks the keyboard for a keystroke.
8:	ClrHome	Clears the display.
9:	ClrTable	Clears the current table.
0:	GetCalc(Gets a variable from another TI-84 Plus CE.
A:	Get(Gets a variable from a USB connected device. The device being used governs how to use this functionality.
B:	Send(Sends a variable to a USB connected device. The device

being used governs how to use this functionality.

Returns an evaluated expression as a string with 8

significant digits.

D: expr(Converts the character string contained in *string* to an

expression and executes it.

E: toString(Converts value to a string where *value* can be real,

complex, an evaluated expression, list, or matrix.

F: String Equ(.NEW

Note: Press + when a command is highlighted in a menu to use the syntax help for your programming.

These instructions control input to and output from a program during execution. They allow you to enter values and display answers during program execution.

To return to the program editor without selecting an item, press CLEAR.

Displaying a Graph with Input

Input without a variable displays the current graph. You can move the free-moving cursor, which updates X and Y (and R and θ for **PolarGC** format). The pause indicator is on. Press **ENTER** to resume program execution.

Input

C:

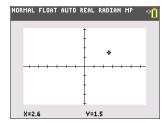

eval(

Program

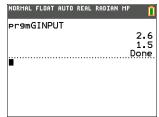

Output

Program

Output

Storing a Variable Value with Input

Input with *variable* displays a ? (question mark) prompt during execution. *variable* may be a real number, complex number, list, matrix, string, or Y= function. During program execution, enter a value, which can be an expression, and then press [ENTER]. The value is evaluated and stored to *variable*, and the program resumes execution.

Input [variable]

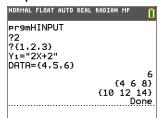

You can display text or the contents of Strn (a string variable) of up to 26 characters as a prompt. During program execution, enter a value after the prompt and then press ENTER]. The value is stored to *variable*, and the program resumes execution.

Input ["text",variable] Input [Strn,variable]

Program

Output

Note: When a program prompts for input of lists and **Y**n functions during execution, you must include the braces ({ }) around the list elements and quotation marks (") around the expressions.

Prompt

During program execution, **Prompt** displays each *variable*, one at a time, followed by =?. At each prompt, enter a value or expression for each *variable*, and then press [ENTER]. The values are stored, and the program resumes execution.

Prompt *variableA*[,*variableB*,...,*variable n*]

Program

Output

Note: Y= functions are not valid with Prompt.

Disp

Displaying the Home Screen

Disp (display) without a value displays the home screen. To view the home screen during program execution, follow the **Disp** instruction with a **Pause** instruction.

Displaying Values and Messages

Disp with one or more *values* displays the value of each.

Disp [valueA,valueB,valueC,...,value n]

- If *value* is a variable, the current value is displayed.
- If value is an expression, it is evaluated and the result is displayed on the right side
 of the next line.
- If value is text within quotation marks, it is displayed on the left side of the current display line. → is not valid as text.

Program

Output

If Pause is encountered after Disp, the program halts temporarily so you can examine the screen. To resume execution, press ENTER.

Note: If a matrix or list is too large to display in its entirety, ellipses (...) are displayed in the last column, but the matrix or list cannot be scrolled. To scroll, use Pause value.

DispGraph

DispGraph (display graph) displays the current graph. If Pause is encountered after **DispGraph**, the program halts temporarily so you can examine the screen. Press ENTER to resume execution.

DispTable

DispTable (display table) displays the current table. The program halts temporarily so you can examine the screen. Press ENTER to resume execution.

Output(

Output(displays text or value on the current home screen beginning at row (1 through 10) and *column* (1 through 26), overwriting any existing characters.

Note: You may want to precede Output(with CirHome.

Expressions are evaluated and values are displayed according to the current mode settings. Matrices are displayed in entry format and wrap to the next line. \rightarrow is not valid as text.

Output(row,column,"text") Output(row,column,value)

Program

Output

For **Output(** on a **Horiz** split screen, the maximum value for row is 4.

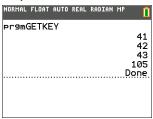

getKey

getKey returns a number corresponding to the last key pressed, according to the key code diagram below. If no key has been pressed, **getKey** returns 0. Use **getKey** inside loops to transfer control, for example, when creating video games.

Program

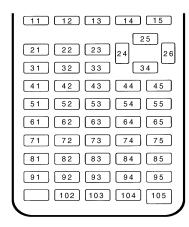

Output

Note: MATH, APPS, PRGM, and ENTER were pressed during program execution.

Note: You can press ON at any time during execution to break the program.

TI-84 Plus CE Key Code Diagram

ClrHome, ClrTable

CIrHome (clear home screen) clears the home screen during program execution.

CIrTable (clear table) clears the values in the table during program execution.

GetCalc(

GetCalc(gets the contents of *variable* on another TI-84 Plus CE and stores it to variable on the receiving TI-84 Plus CE. variable can be a real or complex number, list element, list name, matrix element, matrix name, string, Y= variable, graph database, or picture.

GetCalc(variable[,portflag])

By default, the TI-84 Plus CE uses the USB port if it is connected. If the USB cable is not connected, it uses the I/O port. If you want to specify either the USB or I/O port, use the following portflag numbers:

portflag=0 use USB port if connected; portflag=1 use USB port; portflag=2 use I/O port (Ignored when program runs on the TI-84 Plus CE.)

Note: GetCalc(does not work between TI-82 and TI-83 Plus or a TI-82, TI-84 Plus and TI-84 Plus CF calculators.

Get(, Send(

Get(

Get(Retrieves a value from a connected TI-Innovator™ Hub and stores the data to a variable on the receiving CE calculator.

Get(variable)

Notes:

- Use **GetCalc(** to get data from another CE calculator.
- You can access Get(, Send(and GetCalc(from the CATALOG to execute them from the home screen.

Program

Output

TI-Innovator™ Hub Tips:

Get(command definition is specific to the TI-8x calculator and the cable connection via DBus or USB. The CE calculator is USB connectivity only and here, **Get(** is designed for communication with the TI-Innovator™ Hub.

See also Send(and eval(.

See the HUB menu for TI-Innovator™ Hub details.

Send(

Sends one or more TI-Innovator™ Hub commands to a connected hub.

Send(string)

Program

Output

Turns blue LED on for 5 seconds when sent to connected TI-Innovator™ Hub.

TI-Innovator™ Hub Tips:

See also eval(and Get(commands related to the Send(command.

TI-Innovator™ Hub commands are supported in the HUB submenu in the CE OS v.5.2 program editor.

See the HUB menu for TI-Innovator™ Hub details.

eval(

eval(returns an evaluated expression as a string with 8 significant digits. The expression must simplify to a real expression.

eval(expression)

Program

Output

TI-Innovator™ Hub Tips:

eval(may be used within a string in the Send(command. The evaluated expression replaces eval(expression) with the result as characters within the string.

For debugging purposes, using the command line Disp Ans immediately after a command line using Send(displays the complete string being sent.

See the HUB menu for TI-Innovator™ Hub details.

Program

Output: Using Disp Ans after Send(command

```
NORMAL FLOAT AUTO REAL RADIAN MP
pr9mS0NG2
SET SOUND 260 TIME 0.25
SET SOUND 262 TIME 0.25
SET SOUND 294 TIME 0.5
SET SOUND 262 TIME 0.5
Done
```

expr(

Converts the character string contained in *string* to an expression and executes the expression. string can be a string or a string variable.

expr(string)

Program

Output

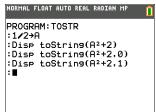

toString(

Converts value to a string where value can be real, complex, an evaluated expression, list, or matrix. String value displays in classic format (0) following the mode setting AUTO/DEC or in decimal format (1).

toString(value[,format])

Program

Output

String Equ(

String Equ(converts string into an equation and stores the equation to **Y**n. string can be a string or string variable. **String Equ(** is the inverse of **Equ)String(**.

String Equ(string, Yn)

Program

```
NORMAL FLOAT AUTO REAL RADIAN MP
PROGRAM: STREQU
:"2X">Str2
:String>Equ(Str2,Y2)
:Disp "Y2(-10)=",Y2(-10)
```

Output

```
NORMAL FLOAT AUTO REAL RADIAN MP
pr9mSTREQU
Y2(-10)=
                     -20
Done Done
```

PRGM COLOR Instructions

This section describes the COLOR menu and the color numbers to use as arguments where setting color is an option such as GraphColor(.

You can paste the color token, such as BLUE, or use the color number, such as 10, shown in the table below.

PRGM COLOR Menu

To display the **PRGM COLOR** menu, press PRGM • from within the program editor only.

CTRL	. I/O	COLOR	EXEC	HUB
			Descripti	on
1:	BLUE		#color = 1	0
2:	RED		#color = 1	1
3:	BLACK		#color = 1	2
4:	MAGENTA		#color = 1	3
5:	GREEN		#color = 1	4
6:	ORANGE		#color = 1	5
7:	BROWN		#color = 1	6
8:	NAVY		#color = 1	7
9:	LTBLUE		#color = 1	8
0:	YELLOW		#color = 1	9
A:	WHITE		#color = 2	0
B:	LTGRAY		#color = 2	1
C:	MEDGRAY		#color = 2	2
D:	GRAY		#color = 2	3
E:	DARKGRAY		#color = 2	4

Note: You can also choose a color name in the vars menu (COLOR sub-menu).

PRGM EXEC Instructions

Calling Other Programs as Subroutines

On the TI CE family of graphing calcualtors, any stored program can be called from another program as a subroutine. Enter the name of the program to use as a subroutine on a line by itself.

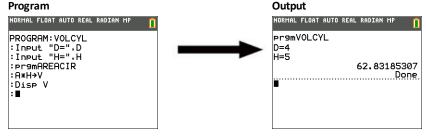

Calling a Program from Another Program

You can enter a program name on a command line in either of two ways.

- Press PRGM \(\) to display the **PRGM EXEC** menu and select the name of the program prgmname is pasted to the current cursor location on a command line.
- Select prgm from the PRGM CTL menu, and then enter the program name.

prgmname

When prgmname is encountered during execution, the next command that the program executes is the first command in the second program. It returns to the subsequent command in the first program when it encounters either Return or the implied Return at the end of the second program.

Subroutine ↓↑

Notes about Calling Programs

Variables are global.

label used with Goto and LbI is local to the program where it is located. label in one program is not recognized by another program. You cannot use Goto to branch to a label in another program.

Return exits a subroutine and within nested loops.	returns to the cal	ling program, even	if it is encountered

PRGM HUB Instructions

TI-Innovator™ HUB Menu Instructions

This section describes the TI-Innovator™ **HUB** Menu Instructions.

See <u>TI-Innovator™ System</u> activities for details and parameter values for specific sensors and controls. This section describes the instructions or commands contained in the TI-Innovator™ HUB menu and how the commands paste to the program editor.

TI-Innovator™ HUB Menu

To display the TI-Innovator™ **HUB** menu, press PRGM from the program editor only.

Important Tip: To quickly find a command, use alpha ► or alpha ▼ to page through screens.

- If [A-lock] is on, then A and will page through screens in menus and the program edit screen.
- After entering alpha characters, remember to turn off [A-lock] to avoid unexpected paging of screens.

B:	Send("DISCONNECT-OUTPUT	Builds out a Send(command to paste to editor
C:	Send("DISCONNECT-INPUT	Builds out a Send(command to paste to editor
D:	Manage	Pastes several commands (:) to editor

For Catalog Help when using the commands eval(, Get(, or Wait, press +.

To return to the program editor without selecting an item, press CLEAR until the cursor returns to the program editor.

Warning: Do not press <u>CLEAR</u> repeatedly unless you are viewing the screen navigation. Once the menus are cleared, pressing clear again may clear an entire line of your program. There is no undo in the program editor.

Before you begin

This section provides descriptions of how each menu item pastes to the program editor. For specific TI-Innovator™ System information dealing with syntax and parameters for each sensor, see specific information in the TI-Innovator™ System activities and kits. You may also type the TI-Innovator™ Hub command (only) letter by letter using the [alpha] key, ["], [], etc.

Extra spaces are pasted for your convenience. TI-Innovator™ Hub sketch will ignore extra spaces within quotation marks in a **Send(** command. However, when you run your program, extra spaces cannot be at the end of command lines and will give you a syntax error. If you get a syntax error at the end of a line, check for extra spaces and delete.

How does the Send(command build out a TI-Innovator™ Hub command from the HUB menu?

From the **HUB** menu, select a **Send(** command. The next screen will give you options for that format of **Send(**.

Example: To paste **Send("SET COLOR.RED** to the program editor, follow these steps.

 With cursor on a command line in the program editor, press prom to get to the programming command menus.

Select 1:Send("SET...

The "..." indicates there is another menu of options.

3. Select 3:COLOR.RED.

NORMAL FLOAT AUTO REAL RADIAN MP CTL I/O COLOR EXEC HUB Send("SET... 2: Send ("READ... 3:Settings... 4:Wait 5:Get(6:eval(7:Send("CONNECT-Output... 8: Send("CONNECT-Input... 9↓Ports...

NORMAL FLOAT AUTO REAL RADIAN MP Send("SET 1:LIGHT 2:COLOR SHCOLOR RED 4: COLOR. GREEN 5:COLOR.BLUE 6:SOUND 7:LED 8:SPEAKER 9↓BUZZER

4. The entire **Send(** command line pastes to the program editor. Repeat to select more TI-Innovator™

Hub commands.

Use alpha ["] and [) to complete the Send(command when appropriate.

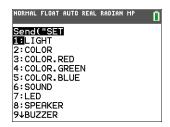

Note: All TI-Innovator™ Hub commands using Send(within quote marks can be typed in using the [alpha] keys on the keypad.

For colors, do not use the COLOR token command from the COLOR menu when communicating with TI-Innovator.™ Hub.

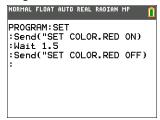

Send("Set...

The **SET** command instructs the "TI-Innovator™ Hub sketch to **SET** the value of the specified object. It supports all of the 'named' objects.

Program

Output

Example: This switches a red **LED** on for 1.5 seconds and then switches it off.

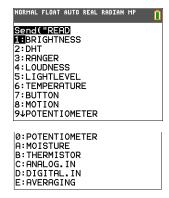

Note: The power LED is green.

The **ON** and **OFF** command can be typed in or are found in the **Settings...** menu item in the **HUB** menu.

Use [alpha] [_] for space as needed.

Send("READ...

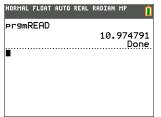

The 'READ' command is to instruct the TI-Innovator™ Hub sketch to read the value from the specified port/pin/object. It supports all of the 'named' objects. It can also be used with 'raw' pin addresses. It needs to be followed by a 'Get(command to actually transfer the information to a variable to use or display the variable value.

Program

Output

Settings...

Settings menu contains operations to set the state of digital and analog pin operations such as the LED in the TI-Innovator™ Hub or a connected servo motor movement to states such as ON, OFF, CW (clockwise), and CCW (counterclockwise).

See TI-Innovator™ System activity kits for more details.

9↓CCW

0:TOGGLE A:PULLUP B:PULLDOWN C:INPUT

Program

Output

Example: This switches a red **LED** on for 1.5 seconds and then switches it off.

Reminder: The power LED is green.

Wait

Wait suspends execution of a program for a given time. Maximum time is 100 seconds. During the wait time, the busy indicator is on in the top-right corner of the screen.

Wait time

Program

```
NORMAL FLOAT AUTO REAL RADIAN MP
PROGRAM: WAIT
:ClrDraw
:AxesOff:FnOff
:TextColor(MAGENTA)
:Text(2,2,"HELL0
                     WORLD"
:Wait 5
:TextColor(GREEN)
:Text(24,2,"BYE!"
```

Output: "Bye!" displays after 5 seconds.

TI-Innovator™ Hub Tips:

Wait may be used in TI-Innovator™ Hub programs to allow time for sensor or control communications prior to the program executing the next command line.

Get(

Get(Retrieves a value from a connected TI-Innovator™ Hub and stores the data to a variable on the receiving CE calculator.

Get(variable)

Notes:

- Use GetCalc(to get data from another CE calculator.
- You can access Get(, Send(and GetCalc(from the CATALOG to execute them from the home screen.

Program

Output

TI-Innovator™ Hub Tips:

Get(command definition is specific to the TI-8x calculator and the cable connection via DBus or USB. The CE calculator is USB connectivity only and here, **Get(** is designed for communication with the TI-Innovator™ Hub.

See also Send(and eval(.

eval(

eval(returns an evaluated expression as a string with 8 significant digits. The expression must simplify to a real expression.

eval(expression)

Program

Output

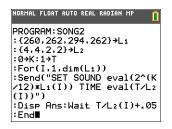

TI-Innovator™ Hub Tips:

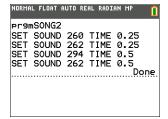

eval(may be used within a string in the Send(command. The evaluated expression replaces eval(expression) with the result as characters within the string

For debugging purposes, using the command line Disp Ans immediately after a command line using **Send(** displays the complete string being sent.

Program

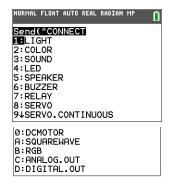

Output: Using Disp Ans after Send(command line.

Send("CONNECT-OUTPUT...

CONNECT (Output) associates a given control or sensor with a pin or port on the TI-Innovator™.

Program

Output

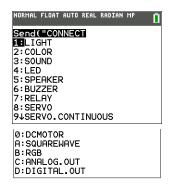

Connects servo motor to OUT3.

Note: The **BEGIN** command puts the string "**READY**" in the TI-Innovator output buffer. The **Get(Str0)** command moves "**READY**" from the output buffer to string variable 0 on the calculator. Executing **Get** forces a communication connection between the TI-84 CE and the TI-Innovator, this is a superior approach to Wait 1 for assuring that the TI-Innovator is initiated. **Disp Str0** displays "**READY**" on the home screen to inform the user that the **BEGIN** command is complete.

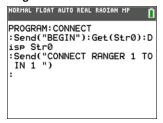

If the output buffer has not been cleared of "READY", the first **Get(** command will return an incorrect value.

Send("CONNECT-INPUT...

CONNECT (Input) associates a given control or sensor with a pin or port on the TI-Innovator™ Hub.

Program

Output

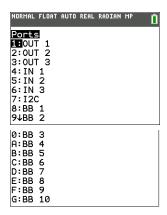

Connects an external range finder to IN 1.

Note: The BEGIN command puts the string "READY" in the TI-Innovator output buffer. The Get(Str0) command moves "READY" from the output buffer to string variable 0 on the calculator. Executing Get forces a communication connection between the TI-84 CE and the TI-Innovator, this is a superior approach to Wait 1 for assuring that the TI-Innovator is initiated. Disp Str0 displays "READY" on the home screen to inform the user that the **BEGIN** command is complete.

If the output buffer has not been cleared of "READY", the first Get(command will return an incorrect value.

Ports...

Ports menu lists available ports to connect such as input, output or to a breadboard.

Program

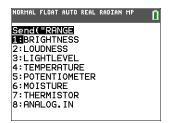

Output

Connects an external range finder to IN 1.

Note: Extra spaces paste such as the space in "IN 1." "IN1" is also accepted by the TI-Innovator™ Hub sketch on TI-Innovator™.

Send("RANGE...

Changes or sets the range to a user-selected range from minimum to a maximum value.

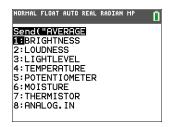

Syntax Examples:

Send("RANGE BRIGHTNESS minimum maximum")

Send("RANGE LIGHTLEVEL # minimum maximum")

Send("AVERAGE...

The AVERAGE command is used to set the number of samples taken to represent an average single sensor reading.

Syntax Examples:

Send("AVERAGE BRIGHTNESS number")

Send("AVERAGE LIGHTLEVEL # number")

Where "number" is the number of readings to average.

Send("DISCONNECT-OUTPUT...

DISCONNECT (Output) breaks the association between a specific control or sensor from a pin or port on the TI-Innovator™.

Program

C:ANALOG.OUT D:DIGITAL.OUT

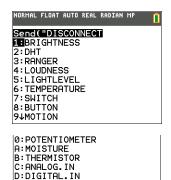

Output

Disconnects the SERVO 1 from use.

Send("DISCONNECT-Input...

DISCONNECT (Input) breaks the association between a specific control or sensor from a pin or port on the TI-Innovator™.

Program

Output

Disconnects range sensor from use.

Manage...

The Manage menu pastes a **Send(** command with the following management items. StrO is displayed on Home Screen with information if requested in the command.

- BEGIN Disconnects all connected sensors and controls. Send("BEGIN") may be needed in a TI-Innovator™ Hub program to re-initialize a sensor or control prior to sending a command to that sensor or control.
- ISTI Responds with TI STEM
- WHO Responds with TI-Innovator™ Hub ON MSP432
- WHAT Responds with TI-Innovator™ Hub
- HELP Responds with USE HELP COMMAND FOR DETAILS
- **VERSION** Responds with TI-Innovator™ Hub version number
- ABOUT Responds with TI-Innovator™ Hub ©2016 Texas Instruments

Note: The [:] is used to sequence command lines on one command line. The **Manage...** menu pastes a convenient set of commands to then display the information in **Str0** on the home screen.

Running an Assembly Language Program

You can run programs written for the TI CE family of graphing calculators in assembly language. Typically, assembly language programs run much faster and provide greater control than the keystroke programs that you write with the built-in program editor.

Note: Because an assembly language program has greater control over the calculator, if your assembly language program has error(s), it may cause your calculator to reset and lose all data, programs, and applications stored in memory.

When you download an assembly language program, it is stored among the other programs as a **PRGM** menu item. You can:

- Transmit it using the TI CE graphing calculator communication link.
- Delete it using the Memory Management/ Delete screen.

To run an assembly Program, the syntax is: **Asm**(assemblyprgmname)

CE OS 5.3 and later the Asm(command is optional.

If you write an assembly language program, use the two instructions below from the CATALOG to identify and compile the program.

Instructions	Comments
AsmComp (prgmASM1, prgmASM2)	Compiles an assembly language program written in ASCII and stores the hex version
Asm84CEPrgm	Identifies an assembly language program; must be entered as the first line of an assembly language program

To compile an assembly program that you have written:

- Follow the steps for writing a program (16-4) but be sure to include Asm84CEPrgm as the first line of your program.
- 2. From the home screen, press [2nd] [CATALOG] and then select AsmComp(to paste it to the screen.
- 3. Press PRGM to display the **PRGM EXEC** menu.
- Select the program you want to compile. It will be pasted to the home screen.
- 5. Press , and then select prgm from the CATALOG.
- 6. Key in the name you have chosen for the output program.

Note: This name must be unique — not a copy of an existing program name.

7. Press) to complete the sequence.

The sequence of the arguments should be as follows:

AsmComp(prgmASM1, prgmASM2)

8. Press ENTER to compile your program and generate the output program.

Note: The TI-84 Plus or TI-84 Plus C Silver Edition AsmPrgm transfers to the TI-84 Plus CE but fails upon execution.
