Shortcuts for Entering Math Expressions

EOS™ (Equation Operating System) Hierarchy

Error Codes and Messages

Texas Instruments Support and Service

Service and Warranty Information

TI-Nspire™ Reference Guide

This guide lists the templates, functions, commands, and operators available for evaluating math expressions.

Expression Templates

Expression templates give you an easy way to enter math expressions in standard mathematical notation. When you insert a template, it appears on the entry line with small blocks at positions where you can enter elements. A cursor shows which element you can enter.

Use the arrow keys or press **tab** to move the cursor to each element's position, and type a value or expression for the element. Press **enter** or **ctrl enter** to evaluate the expression.

Fraction template

ctrl **÷** **keys**

Note: See also **/ (divide)**, page 118.

Example:

$$\frac{12}{8 \cdot 2} = \frac{3}{4}$$

Exponent template

^ **key**

Note: Type the first value, press **^**, and then type the exponent.

To return the cursor to the baseline, press right arrow (**→**).

Note: See also **^ (power)**, page 119.

Example:

$$2^3 = 8$$

Square root template

ctrl **x²** **keys**

Note: See also **√()** **(square root)**, page 125.

Example:

$$\begin{aligned} \sqrt{4} &= 2 \\ \sqrt{\{9, 4, 4\}} &= \{3, \sqrt{\{4\}}, 2\} \\ \sqrt{4} &= 2 \\ \sqrt{\{9, 16, 4\}} &= \{3, 4, 2\} \end{aligned}$$

Nth root template

ctrl **^** **keys**

Note: See also **root()**, page 86.

Example:

$$\begin{aligned} \sqrt[3]{8} &= 2 \\ \sqrt[3]{\{8, 27, 15\}} &= \{2, 3, 2.46621\} \end{aligned}$$

e exponent template**e^x** **key****e**Natural exponential e raised to a power**Note:** See also **e[^]()**, page 31.

Example:

$$e^1 = 2.71828182846$$

Log template**ctrl** **10^x** **key****log**

Calculates log to a specified base. For a default of base 10, omit the base.

Note: See also **log()**, page 58.

Example:

$$\log_4(2) = 0.5$$

Piecewise template (2-piece)**Catalog** > **list****{** **0,0**
{ **0,0**

Lets you create expressions and conditions for a two-piece piecewise function. To add a piece, click in the template and repeat the template.

Note: See also **piecewise()**, page 74.

Example:

**Piecewise template (N-piece)****Catalog** > **list**Lets you create expressions and conditions for an N -piece piecewise function. Prompts for N .

Example:

See the example for Piecewise template (2-piece).

**Note:** See also **piecewise()**, page 74.

System of 2 equations template

Catalog > 

Creates a system of two linear equations. To add a row to an existing system, click in the template and repeat the template.

Note: See also **system()**, page 101.

Example:

$$\text{solve}\left(\begin{cases} x+y=0 \\ x-y=5 \end{cases}, x, y\right) \quad x=\frac{5}{2} \text{ and } y=-\frac{5}{2}$$

$$\text{solve}\left(\begin{cases} y=x^2-2 \\ x+2, y=-1 \end{cases}, x, y\right)$$

$$x=-\frac{3}{2} \text{ and } y=\frac{1}{4} \text{ or } x=1 \text{ and } y=-1$$

System of N equations template

Catalog > 

Lets you create a system of N linear equations. Prompts for N .

Example:

See the example for System of equations template (2-equation).

Note: See also **system()**, page 101.

Absolute value template

Catalog > 

Note: See also **abs()**, page 6.

Example:

$$\left\{ \left\{ 2, -3, 4, -4^3 \right\} \right\} \quad \left\{ 2, 3, 4, 64 \right\}$$

dd°mm'ss.ss" template

Catalog > 

Lets you enter angles in **dd°mm'ss.ss"** format, where **dd** is the number of decimal degrees, **mm** is the number of minutes, and **ss.ss** is the number of seconds.

Example:

$$30^{\circ}15'10'' \quad 0.528011$$

Matrix template (2 x 2)

Catalog > 

Creates a 2 x 2 matrix.

Example:

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \cdot 5 \quad \begin{bmatrix} 5 & 10 \\ 15 & 20 \end{bmatrix}$$

Matrix template (1 x 2)

Catalog > 

$$\begin{bmatrix} \square & \square \end{bmatrix}$$

Example:

$$\text{crossP}\left(\begin{bmatrix} 1 & 2 \end{bmatrix}, \begin{bmatrix} 3 & 4 \end{bmatrix}\right) \quad \begin{bmatrix} 0 & 0 & -2 \end{bmatrix}$$

Matrix template (2 x 1)

Catalog > 

$$\begin{bmatrix} \square \\ \square \end{bmatrix}$$

Example:

$$\begin{bmatrix} 5 \\ 8 \end{bmatrix} \cdot 0.01 \quad \begin{bmatrix} 0.05 \\ 0.08 \end{bmatrix}$$

Matrix template (m x n)

Catalog > 

The template appears after you are prompted to specify the number of rows and columns.

Create a Matrix ✕

Matrix

Number of rows

Number of columns

Example:

$$\text{diag}\left(\begin{pmatrix} 4 & 2 & 6 \\ 1 & 2 & 3 \\ 5 & 7 & 9 \end{pmatrix}\right) \quad \begin{bmatrix} 4 & 2 & 9 \end{bmatrix}$$

Note: If you create a matrix with a large number of rows and columns, it may take a few moments to appear.

Sum template (Σ)

Catalog > 

$$\sum_{n=0}^{\square} (\square)$$

Example:

$$\sum_{n=3}^7 (n) \quad 25$$

Note: See also $\Sigma()$ (**sumSeq**), page 126.

Product template (Π)

Catalog > 

$$\prod_{n=0}^{\square} (\square)$$

Example:

$$\prod_{n=1}^5 \left(\frac{1}{n}\right) \quad \frac{1}{120}$$

Note: See also $\Pi()$ (**prodSeq**), page 125.

First derivative template

Catalog > 

$$\frac{d}{dx}(\square)$$

The first derivative template can be used to calculate first derivative at a point numerically, using auto differentiation methods.

Note: See also **d()** (derivative), page 124.

Example:

$$\frac{d}{dx}(|x|)|_{x=0}$$

undef

Second derivative template

Catalog > 

$$\frac{d^2}{dx^2}(\square)$$

The second derivative template can be used to calculate second derivative at a point numerically, using auto differentiation methods.

Note: See also **d()** (derivative), page 124.

Example:

$$\frac{d^2}{dx^2}(x^3)|_{x=3}$$

18

Definite integral template

Catalog > 

$$\int_a^b \square dx$$

The definite integral template can be used to calculate the definite integral numerically, using the same method as **nint()**.

Note: See also **nint()**, page 68.

Example:

$$\int_0^{10} x^2 dx$$

333.333

Alphabetical Listing

Items whose names are not alphabetic (such as +, !, and >) are listed at the end of this section, starting on page 117. Unless otherwise specified, all examples in this section were performed in the default reset mode, and all variables are assumed to be undefined.

A

abs()

Catalog > 

abs(*Value1*) $\Rightarrow$ *value*
abs(*List1*) $\Rightarrow$ *list*
abs(*Matrix1*) $\Rightarrow$ *matrix*

Returns the absolute value of the argument.

Note: See also **Absolute value template**, page 3.

If the argument is a complex number, returns the number's modulus.

$\left \left\{ \frac{\pi}{2}, \frac{\pi}{3} \right\} \right $	$\{1.5708, 1.0472\}$
$ 2-3 \cdot i $	3.60555

amortTbl()

Catalog > 

amortTbl(*NPmt*,*N*,*I*,*PV*, [*Pmt*], [*FV*], [*PpY*], [*CpY*], [*PmtAr*], [*roundValue*]) $\Rightarrow$ *matrix*

Amortization function that returns a matrix as an amortization table for a set of TVM arguments.

NPmt is the number of payments to be included in the table. The table starts with the first payment.

N, *I*, *PV*, *Pmt*, *FV*, *PpY*, *CpY*, and *PmtAr* are described in the table of TVM arguments, page 108.

- If you omit *Pmt*, it defaults to $Pmt = \mathbf{tvmPmt}(N, I, PV, FV, PpY, CpY, PmtAr)$.
- If you omit *FV*, it defaults to *FV*=0.
- The defaults for *PpY*, *CpY*, and *PmtAr* are the same as for the TVM functions.

roundValue specifies the number of decimal places for rounding. Default=2.

The columns in the result matrix are in this order: Payment number, amount paid to interest, amount paid to principal, and balance.

The balance displayed in row *n* is the balance after payment *n*.

You can use the output matrix as input for the other amortization functions $\Sigma \mathbf{Int}()$ and $\Sigma \mathbf{Prn}()$, page 126, and **bal()**, page 12.

amortTbl(12,60,10,5000,,,12,12)

0	0.	0.	5000.
1	-41.67	-64.57	4935.43
2	-41.13	-65.11	4870.32
3	-40.59	-65.65	4804.67
4	-40.04	-66.2	4738.47

10	-36.66	-69.58	4329.51
11	-36.08	-70.16	4259.35
12	-35.49	-70.75	4188.6

and

Catalog > 

BooleanExpr1 **and** *BooleanExpr2* $\Rightarrow$ *Boolean expression*
BooleanList1 **and** *BooleanList2* $\Rightarrow$ *Boolean list*
BooleanMatrix1 **and** *BooleanMatrix2* $\Rightarrow$ *Boolean matrix*

Returns true or false or a simplified form of the original entry.

andCatalog > *Integer1 and Integer2* $\Rightarrow$ *integer*

Compares two real integers bit-by-bit using an **and** operation. Internally, both integers are converted to signed, 64-bit binary numbers. When corresponding bits are compared, the result is 1 if both bits are 1; otherwise, the result is 0. The returned value represents the bit results, and is displayed according to the Base mode.

You can enter the integers in any number base. For a binary or hexadecimal entry, you must use the 0b or 0h prefix, respectively. Without a prefix, integers are treated as decimal (base 10).

In Hex base mode:

0h7AC36 and 0h3D5F 0h2C16

Important: Zero, not the letter O.

In Bin base mode:

0b100101 and 0b100 0b100

In Dec base mode:

37 and 0b100 4

Note: A binary entry can have up to 64 digits (not counting the 0b prefix). A hexadecimal entry can have up to 16 digits.

angle()Catalog > **angle(Value1)** $\Rightarrow$ *value*

Returns the angle of the argument, interpreting the argument as a complex number.

In Degree angle mode:

 $\text{angle}(0+2 \cdot i)$ 90

In Gradian angle mode:

 $\text{angle}(0+3 \cdot i)$ 100

In Radian angle mode:

 $\text{angle}(1+i)$ 0.785398
$$\text{angle}\left\{\left\{1+2 \cdot i, 3+0 \cdot i, 0-4 \cdot i\right\}\right\}$$

$$\left\{1.10715, 0, -1.5708\right\}$$

$$\text{angle}\left\{\left\{1+2 \cdot i, 3+0 \cdot i, 0-4 \cdot i\right\}\right\}$$

$$\left\{\frac{\pi}{2}-\tan^{-1}\left(\frac{1}{2}\right), 0, -\frac{\pi}{2}\right\}$$
angle(List1) $\Rightarrow$ *list***angle(Matrix1)** $\Rightarrow$ *matrix*

Returns a list or matrix of angles of the elements in *List1* or *Matrix1*, interpreting each element as a complex number that represents a two-dimensional rectangular coordinate point.

ANOVACatalog > **ANOVA** *List1, List2[, List3, ..., List20][, Flag]*

Performs a one-way analysis of variance for comparing the means of two to 20 populations. A summary of results is stored in the *stat.results* variable. (See page 98.)

Flag=0 for Data, *Flag*=1 for Stats

Output variable	Description
stat.F	Value of the F statistic
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.df	Degrees of freedom of the groups
stat.SS	Sum of squares of the groups
stat.MS	Mean squares for the groups
stat.dfError	Degrees of freedom of the errors

Output variable	Description
stat.SSError	Sum of squares of the errors
stat.MSError	Mean square for the errors
stat.sp	Pooled standard deviation
stat.xbarlist	Mean of the input of the lists
stat.CLowerList	95% confidence intervals for the mean of each input list
stat.CUpperList	95% confidence intervals for the mean of each input list

ANOVA2way

Catalog > 

ANOVA2way *List1, List2[, List3, ..., List10][, levRow]*

Computes a two-way analysis of variance for comparing the means of two to 10 populations. A summary of results is stored in the *stat.results* variable. (See page 98.)

LevRow=0 for Block

LevRow=2,3,..., *Len*-1, for Two Factor, where

Len=length(*List1*)=length(*List2*) = length(*List10*) and

Len / *LevRow* ∈ {2,3, }

Outputs: Block Design

Output variable	Description
stat.F	F statistic of the column factor
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.df	Degrees of freedom of the column factor
stat.SS	Sum of squares of the column factor
stat.MS	Mean squares for column factor
stat.FBlock	F statistic for factor
stat.PValBlock	Least probability at which the null hypothesis can be rejected
stat.dfBlock	Degrees of freedom for factor
stat.SSBlock	Sum of squares for factor
stat.MSBlock	Mean squares for factor
stat.dfError	Degrees of freedom of the errors
stat.SSError	Sum of squares of the errors
stat.MSError	Mean squares for the errors
stat.s	Standard deviation of the error

COLUMN FACTOR Outputs

Output variable	Description
stat.Fcol	F statistic of the column factor

Output variable	Description
stat.PValCol	Probability value of the column factor
stat.dfCol	Degrees of freedom of the column factor
stat.SSCol	Sum of squares of the column factor
stat.MSCol	Mean squares for column factor

ROW FACTOR Outputs

Output variable	Description
stat.FRow	F statistic of the row factor
stat.PValRow	Probability value of the row factor
stat.dfRow	Degrees of freedom of the row factor
stat.SSRow	Sum of squares of the row factor
stat.MSRow	Mean squares for row factor

INTERACTION Outputs

Output variable	Description
stat.FInteract	F statistic of the interaction
stat.PValInteract	Probability value of the interaction
stat.dfInteract	Degrees of freedom of the interaction
stat.SSInteract	Sum of squares of the interaction
stat.MSInteract	Mean squares for interaction

ERROR Outputs

Output variable	Description
stat.dfError	Degrees of freedom of the errors
stat.SSError	Sum of squares of the errors
stat.MSError	Mean squares for the errors
s	Standard deviation of the error

Ans

ctrl (←) keys

Ans ⇒ value

Returns the result of the most recently evaluated expression.

56	56
56+4	60
60+4	64

approx()Catalog > **approx**(*Value1*) $\Rightarrow$ *number*

Returns the evaluation of the argument as an expression containing decimal values, when possible, regardless of the current **Auto or Approximate** mode.

This is equivalent to entering the argument and pressing .

.

approx(*List1*) $\Rightarrow$ *list***approx**(*Matrix1*) $\Rightarrow$ *matrix*

Returns a list or *matrix* where each element has been evaluated to a decimal value, when possible.

$\text{approx}\left(\frac{1}{3}\right)$	0.333333
$\text{approx}\left(\left\{\frac{1}{3}, \frac{1}{9}\right\}\right)$	$\{0.333333, 0.111111\}$
$\text{approx}\left(\{\sin(\pi), \cos(\pi)\}\right)$	$\{0, -1\}$
$\text{approx}\left(\left[\sqrt{2}, \sqrt{3}\right]\right)$	$[1.41421 \quad 1.73205]$
$\text{approx}\left(\left[\frac{1}{3}, \frac{1}{9}\right]\right)$	$[0.333333 \quad 0.111111]$
$\text{approx}\left(\{\sin(\pi), \cos(\pi)\}\right)$	$\{0, -1\}$
$\text{approx}\left(\left[\sqrt{2}, \sqrt{3}\right]\right)$	$[1.41421 \quad 1.73205]$

approxFraction()Catalog > *Value* **approxFraction**(*Tol*) $\Rightarrow$ *value**List* **approxFraction**(*Tol*) $\Rightarrow$ *list**Matrix* **approxFraction**(*Tol*) $\Rightarrow$ *matrix*

Returns the input as a fraction, using a tolerance of *Tol*. If *Tol* is omitted, a tolerance of 5.E-14 is used.

Note: You can insert this function from the computer keyboard by typing **@>approxFraction(...)**.

$\frac{1}{2} + \frac{1}{3} + \tan(\pi)$	0.833333
0.8333333333333333	$\text{approxFraction}(5.E-14)$
	$\frac{5}{6}$
$\{\pi, 1.5\}$	$\text{approxFraction}(5.E-14)$
	$\left\{\frac{5419351}{1725033}, \frac{3}{2}\right\}$

approxRational()Catalog > **approxRational**(*Value*, *Tol*) $\Rightarrow$ *value***approxRational**(*List*, *Tol*) $\Rightarrow$ *list***approxRational**(*Matrix*, *Tol*) $\Rightarrow$ *matrix*

Returns the argument as a fraction using a tolerance of *Tol*. If *Tol* is omitted, a tolerance of 5.E-14 is used.

$\text{approxRational}(0.333, 5 \cdot 10^{-5})$	$\frac{333}{1000}$
$\text{approxRational}(\{0.2, 0.33, 4.125\}, 5.E-14)$	$\left\{\frac{1}{5}, \frac{33}{100}, \frac{33}{8}\right\}$

arccos()See $\cos^{-1}$, page 20.**arccosh()**See $\cosh^{-1}$, page 21.**arccot()**See $\cot^{-1}$, page 22.

arctan() See $\tan^{-1}()$, page 102.

arctanh() See $\tanh^{-1}()$, page 103.

augment() Catalog > 

augment(List1, List2) $\Rightarrow$ list

Returns a new list that is *List2* appended to the end of *List1*.

$$\text{augment}(\{1, -3, 2\}, \{5, 4\}) \quad \{1, -3, 2, 5, 4\}$$

augment(Matrix1, Matrix2) $\Rightarrow$ matrix

Returns a new matrix that is *Matrix2* appended to *Matrix1*. When the "," character is used, the matrices must have equal row dimensions, and *Matrix2* is appended to *Matrix1* as new columns. Does not alter *Matrix1* or *Matrix2*.

$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \rightarrow m1$	$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$
$\begin{bmatrix} 5 \\ 6 \end{bmatrix} \rightarrow m2$	$\begin{bmatrix} 5 \\ 6 \end{bmatrix}$
$\text{augment}(m1, m2)$	$\begin{bmatrix} 1 & 2 & 5 \\ 3 & 4 & 6 \end{bmatrix}$

avgRC()Catalog > **avgRC**(Expr1, Var [=Value] [, Step]) $\Rightarrow$ expression**avgRC**(Expr1, Var [=Value] [, List1]) $\Rightarrow$ list**avgRC**(List1, Var [=Value] [, Step]) $\Rightarrow$ list**avgRC**(Matrix1, Var [=Value] [, Step]) $\Rightarrow$ matrix

Returns the forward-difference quotient (average rate of change).

Expr1 can be a user-defined function name (see **Func**).

When Value is specified, it overrides any prior variable assignment or any current “|” substitution for the variable.

Step is the step value. If Step is omitted, it defaults to 0.001.

Note that the similar function **centralDiff()** uses the central-difference quotient.

$x:=2$	2
$\text{avgRC}(x^2-x+2,x)$	3.001
$\text{avgRC}(x^2-x+2,x,1)$	3.1
$\text{avgRC}(x^2-x+2,x,3)$	6

B**bal()**Catalog > **bal**(NPmt,N,I,PV,[Pmt],[FV],[PpY],[CpY],[PmtAt],[roundValue]) $\Rightarrow$ value**bal**(NPmt,amortTable) $\Rightarrow$ value

Amortization function that calculates schedule balance after a specified payment.

N, I, PV, Pmt, FV, PpY, CpY, and PmtAt are described in the table of TVM arguments, page 108.

NPmt specifies the payment number after which you want the data calculated.

N, I, PV, Pmt, FV, PpY, CpY, and PmtAt are described in the table of TVM arguments, page 108.

- If you omit Pmt, it defaults to $Pmt=\text{tvmPmt}(N,I,PV,FV,PpY,CpY,PmtAt)$.
- If you omit FV, it defaults to $FV=0$.
- The defaults for PpY, CpY, and PmtAt are the same as for the TVM functions.

roundValue specifies the number of decimal places for rounding. Default=2.

bal(NPmt,amortTable) calculates the balance after payment number NPmt, based on amortization table amortTable. The amortTable argument must be a matrix in the form described under **amortTbl()**, page 6.**Note:** See also **$\Sigma\text{Int}()$** and **$\Sigma\text{Prn}()$** , page 126.

$\text{bal}(5,6,5.75,5000,,12,12)$	833.11

►Base2Catalog > Integer1 ►Base2 $\Rightarrow$ integer**Note:** You can insert this operator from the computer keyboard by typing @>Base2.

Converts Integer1 to a binary number. Binary or hexadecimal numbers always have a 0b or 0h prefix, respectively.

256►Base2	0b100000000
0h1F►Base2	0b11111

Zero, not the letter O, followed by b or h.

0b *binaryNumber*
0h *hexadecimalNumber*

A binary number can have up to 64 digits. A hexadecimal number can have up to 16.

Without a prefix, *Integer1* is treated as decimal (base 10). The result is displayed in binary, regardless of the Base mode.

Negative numbers are displayed in “two’s complement” form. For example,

–1 is displayed as
0hFFFFFFFFFFFFFF in Hex base mode
0b111...111 (64 1’s) in Binary base mode

–2⁶³ is displayed as
0h8000000000000000 in Hex base mode
0b100...000 (63 zeros) in Binary base mode

If you enter a decimal integer that is outside the range of a signed, 64-bit binary form, a symmetric modulo operation is used to bring the value into the appropriate range. Consider the following examples of values outside the range.

2⁶³ becomes –2⁶³ and is displayed as
0h8000000000000000 in Hex base mode
0b100...000 (63 zeros) in Binary base mode

2⁶⁴ becomes 0 and is displayed as
0h0 in Hex base mode
0b0 in Binary base mode

–2⁶³ – 1 becomes 2⁶³ – 1 and is displayed as
0h7FFFFFFFFFFFFFFF in Hex base mode
0b111...111 (64 1’s) in Binary base mode

►Base10

Integer1 ►Base10 ⇒ *integer*

Note: You can insert this operator from the computer keyboard by typing @►Base10.

Converts *Integer1* to a decimal (base 10) number. A binary or hexadecimal entry must always have a 0b or 0h prefix, respectively.

0b *binaryNumber*
0h *hexadecimalNumber*

Zero, not the letter O, followed by b or h.

A binary number can have up to 64 digits. A hexadecimal number can have up to 16.

Without a prefix, *Integer1* is treated as decimal. The result is displayed in decimal, regardless of the Base mode.

0b10011►Base10	19
0h1F►Base10	31

►Base16

Catalog > 

Integer1 ►Base16 $\Rightarrow$ integer

Note: You can insert this operator from the computer keyboard by typing @►Base16.

Converts *Integer1* to a hexadecimal number. Binary or hexadecimal numbers always have a 0b or 0h prefix, respectively.

0b *binaryNumber*

0h *hexadecimalNumber*

Zero, not the letter O, followed by b or h.

A binary number can have up to 64 digits. A hexadecimal number can have up to 16.

Without a prefix, *Integer1* is treated as decimal (base 10). The result is displayed in hexadecimal, regardless of the Base mode.

If you enter a decimal integer that is too large for a signed, 64-bit binary form, a symmetric modulo operation is used to bring the value into the appropriate range. For more information, see ►Base2, page 12.

256►Base16	0h100
------------	-------

0b111100001111►Base16	0hF0F
-----------------------	-------

binomCdf()

Catalog > 

binomCdf(*n*,*p*) $\Rightarrow$ number

binomCdf(*n*,*p*,*lowBound*,*upBound*) $\Rightarrow$ number if *lowBound* and *upBound* are numbers, list if *lowBound* and *upBound* are lists

binomCdf(*n*,*p*,*upBound*) for $P(0 \leq X \leq \text{upBound})$ $\Rightarrow$ number if *upBound* is a number, list if *upBound* is a list

Computes a cumulative probability for the discrete binomial distribution with *n* number of trials and probability *p* of success on each trial.

For $P(X \leq \text{upBound})$, set *lowBound*=0

binomPdf()

Catalog > 

binomPdf(*n*,*p*) $\Rightarrow$ number

binomPdf(*n*,*p*,*XVal*) $\Rightarrow$ number if *XVal* is a number, list if *XVal* is a list

Computes a probability for the discrete binomial distribution with *n* number of trials and probability *p* of success on each trial.

C

ceiling()

Catalog > 

ceiling(*Value1*) $\Rightarrow$ value

Returns the nearest integer that is $\geq$ the argument.

The argument can be a real or a complex number.

Note: See also **floor**().

ceiling(*List1*) $\Rightarrow$ list

ceiling(*Matrix1*) $\Rightarrow$ matrix

Returns a list or matrix of the ceiling of each element.

ceiling (.456)	1.
-----------------------	----

ceiling ({-3.1,1.2,5})	{-3.,1,3.}
-------------------------------	------------

ceiling ($\begin{bmatrix} 0 & -3.2 \cdot i \\ 1.3 & 4 \end{bmatrix}$)	$\begin{bmatrix} 0 & -3 \cdot i \\ 2. & 4 \end{bmatrix}$
--	--

centralDiff()Catalog > **centralDiff**(*Expr1*, *Var* [= *Value*], [*Step*]) $\Rightarrow$ *expression***centralDiff**(*Expr1*, *Var* [, *Step*]) [*Var* = *Value*] $\Rightarrow$ *expression***centralDiff**(*Expr1*, *Var* [= *Value*], [*List*]) $\Rightarrow$ *list***centralDiff**(*List1*, *Var* [= *Value*], [*Step*]) $\Rightarrow$ *list***centralDiff**(*Matrix1*, *Var* [= *Value*], [*Step*]) $\Rightarrow$ *matrix*

Returns the numerical derivative using the central difference quotient formula.

When *Value* is specified, it overrides any prior variable assignment or any current "[" substitution for the variable.

Step is the step value. If *Step* is omitted, it defaults to 0.001.

When using *List1* or *Matrix1*, the operation gets mapped across the values in the list or across the matrix elements.

Note: See also **avgRC()**.

$$\text{centralDiff}(\cos(x), x) \Big|_{x=\frac{\pi}{2}} = -1.$$

char()Catalog > **char**(*Integer*) $\Rightarrow$ *character*

Returns a character string containing the character numbered *Integer* from the handheld character set. The valid range for *Integer* is 0–65535.

char (38)	"&"
char (65)	"A"

 χ^2 2wayCatalog >  **χ^2 2way** *obsMatrix***chi22way** *obsMatrix*

Computes a χ^2 test for association on the two-way table of counts in the observed matrix *obsMatrix*. A summary of results is stored in the *stat.results* variable. (See page 98.)

For information on the effect of empty elements in a matrix, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat. χ^2	Chi square stat: $\text{sum}(\text{observed} - \text{expected})^2 / \text{expected}$
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.df	Degrees of freedom for the chi square statistics
stat.ExpMat	Matrix of expected elemental count table, assuming null hypothesis
stat.CompMat	Matrix of elemental chi square statistic contributions

χ^2 Cdf()

Catalog > 

χ^2 Cdf(*lowBound*,*upBound*,*df*) $\Rightarrow$ number if *lowBound* and *upBound* are numbers, list if *lowBound* and *upBound* are lists
chi2Cdf(*lowBound*,*upBound*,*df*) $\Rightarrow$ number if *lowBound* and *upBound* are numbers, list if *lowBound* and *upBound* are lists

Computes the χ^2 distribution probability between *lowBound* and *upBound* for the specified degrees of freedom *df*.

For $P(X \leq \text{upBound})$, set *lowBound* = 0.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

χ^2 GOF

Catalog > 

χ^2 GOF *obsList*,*expList*,*df*
chi2GOF *obsList*,*expList*,*df*

Performs a test to confirm that sample data is from a population that conforms to a specified distribution. *obsList* is a list of counts and must contain integers. A summary of results is stored in the *stat.results* variable. (See page 98.)

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat. χ^2	Chi square stat: $\text{sum}((\text{observed} - \text{expected})^2 / \text{expected})$
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.df	Degrees of freedom for the chi square statistics
stat.CompList	Elemental chi square statistic contributions

χ^2 Pdf()

Catalog > 

χ^2 Pdf(*XVal*,*df*) $\Rightarrow$ number if *XVal* is a number, list if *XVal* is a list
chi2Pdf(*XVal*,*df*) $\Rightarrow$ number if *XVal* is a number, list if *XVal* is a list

Computes the probability density function (pdf) for the χ^2 distribution at a specified *XVal* value for the specified degrees of freedom *df*.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

ClearAZ

Catalog > 

ClearAZ

Clears all single-character variables in the current problem space.

If one or more of the variables are locked, this command displays an error message and deletes only the unlocked variables. See **unLock**, page 110.

$5 \rightarrow b$	5
<i>b</i>	5
ClearAZ	Done
<i>b</i>	"Error: Variable is not defined"

ClrErrCatalog > **ClrErr**

Clears the error status and sets system variable *errCode* to zero.

For an example of **ClrErr**, See Example 2 under the **Try** command, page 106.

The **Else** clause of the **Try...Else...EndTry** block should use **ClrErr** or **PassErr**. If the error is to be processed or ignored, use **ClrErr**. If what to do with the error is not known, use **PassErr** to send it to the next error handler. If there are no more pending **Try...Else...EndTry** error handlers, the error dialog box will be displayed as normal.

Note: See also **PassErr**, page 74, and **Try**, page 106.

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing  instead of  at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

colAugment()Catalog > 

colAugment(*Matrix1*, *Matrix2*) $\Rightarrow$ *matrix*

Returns a new matrix that is *Matrix2* appended to *Matrix1*. The matrices must have equal column dimensions, and *Matrix2* is appended to *Matrix1* as new rows. Does not alter *Matrix1* or *Matrix2*.

$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \rightarrow m1$	$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$
$\begin{bmatrix} 5 & 6 \end{bmatrix} \rightarrow m2$	$\begin{bmatrix} 5 & 6 \end{bmatrix}$
$\text{colAugment}(m1, m2)$	$\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix}$

colDim()Catalog > 

colDim(*Matrix*) $\Rightarrow$ *expression*

Returns the number of columns contained in *Matrix*.

Note: See also **rowDim**().

$\text{colDim}\left(\begin{bmatrix} 0 & 1 & 2 \\ 3 & 4 & 5 \end{bmatrix}\right)$	3
--	---

colNorm()Catalog > 

colNorm(*Matrix*) $\Rightarrow$ *expression*

Returns the maximum of the sums of the absolute values of the elements in the columns in *Matrix*.

Note: Undefined matrix elements are not allowed. See also **rowNorm**().

$\begin{bmatrix} 1 & -2 & 3 \\ 4 & 5 & -6 \end{bmatrix} \rightarrow mat$	$\begin{bmatrix} 1 & -2 & 3 \\ 4 & 5 & -6 \end{bmatrix}$
$\text{colNorm}(mat)$	9

completeSquare()

Catalog > 

completeSquare(ExprOrEqn, Var) $\Rightarrow$ expression or equation

completeSquare(ExprOrEqn, Var^Power) $\Rightarrow$ expression or equation

completeSquare(ExprOrEqn, Var1 Var2 [...]) $\Rightarrow$ expression or equation

completeSquare(ExprOrEqn, {Var1 Var2 [...]}) $\Rightarrow$ expression or equation

Converts a quadratic polynomial expression of the form $a \cdot x^2 + b \cdot x + c$ into the form $a \cdot (x-h)^2 + k$

- or -

Converts a quadratic equation of the form $a \cdot x^2 + b \cdot x + c = d$ into the form $a \cdot (x-h)^2 = k$

The first argument must be a quadratic expression or equation in standard form with respect to the second argument.

The Second argument must be a single univariate term or a single univariate term raised to a rational power, for example x , y^2 , or $z^{(1/3)}$.

The third and fourth syntax attempt to complete the square with respect to variables Var1, Var2 [...].

$$\text{completeSquare}(x^2 + 2 \cdot x + 3, x) \quad (x+1)^2 + 2$$

$$\text{completeSquare}(x^2 + 2 \cdot x = 3, x) \quad (x+1)^2 = 4$$

$$\text{completeSquare}(x^6 + 2 \cdot x^3 + 3, x^3) \quad (x^3 + 1)^2 + 2$$

$$\text{completeSquare}(x^2 + 4 \cdot x + y^2 + 6 \cdot y + 3 = 0, x, y) \\ (x+2)^2 + (y+3)^2 = 10$$

$$\text{completeSquare}(x^2 + 2 \cdot y + 7 \cdot y^2 + 4 \cdot x = 3, \{x, y\}) \\ 3 \cdot \left(x + \frac{2}{3}\right)^2 + 7 \cdot \left(y + \frac{1}{7}\right)^2 = \frac{94}{21}$$

$$\text{completeSquare}(x^2 + 2 \cdot x \cdot y \cdot x, y) \quad (x+y)^2 - y^2$$

conj()

Catalog > 

conj(Value1) $\Rightarrow$ value

conj(List1) $\Rightarrow$ list

conj(Matrix1) $\Rightarrow$ matrix

Returns the complex conjugate of the argument.

$$\text{conj}(1 + 2 \cdot i) \quad 1 - 2 \cdot i$$

$$\text{conj}\left(\begin{bmatrix} 2 & 1 - 3 \cdot i \\ -i & -7 \end{bmatrix}\right) \quad \begin{bmatrix} 2 & 1 + 3 \cdot i \\ i & -7 \end{bmatrix}$$

constructMat()

Catalog > 

constructMat(Expr, Var1, Var2, numRows, numCols) $\Rightarrow$ matrix

Returns a matrix based on the arguments.

Expr is an expression in variables Var1 and Var2. Elements in the resulting matrix are formed by evaluating Expr for each incremented value of Var1 and Var2.

Var1 is automatically incremented from 1 through numRows. Within each row, Var2 is incremented from 1 through numCols.

$$\text{constructMat}\left(\frac{1}{i+j}, i, j, 3, 4\right) \quad \begin{bmatrix} \frac{1}{2} & \frac{1}{3} & \frac{1}{4} & \frac{1}{5} \\ \frac{1}{3} & \frac{1}{4} & \frac{1}{5} & \frac{1}{6} \\ \frac{1}{4} & \frac{1}{5} & \frac{1}{6} & \frac{1}{7} \end{bmatrix}$$

CopyVar

Catalog > 

CopyVar Var1, Var2

CopyVar Var1., Var2.

CopyVar Var1, Var2 copies the value of variable Var1 to variable Var2, creating Var2 if necessary. Variable Var1 must have a value.

If Var1 is the name of an existing user-defined function, copies the definition of that function to function Var2. Function Var1 must be defined.

Var1 must meet the variable-naming requirements or must be an indirection expression that simplifies to a variable name meeting the requirements.

$$\text{Define } a(x) = \frac{1}{x} \quad \text{Done}$$

$$\text{Define } b(x) = x^2 \quad \text{Done}$$

$$\text{CopyVar } a, c: c(4) \quad \frac{1}{4}$$

$$\text{CopyVar } b, c: c(4) \quad 16$$

CopyVar

Catalog > 

CopyVar *Var1.*, *Var2.* copies all members of the *Var1.* variable group to the *Var2.* group, creating *Var2.* if necessary.

Var1. must be the name of an existing variable group, such as the statistics *stat.nn* results, or variables created using the **LibShortcut()** function. If *Var2.* already exists, this command replaces all members that are common to both groups and adds the members that do not already exist. If one or more members of *Var2.* are locked, all members of *Var2.* are left unchanged.

<i>aa.a</i> :=45	45
<i>aa.b</i> :=6.78	6.78
<i>aa.c</i> :=8.9	8.9
getVarInfo()	$\begin{bmatrix} aa.a & \text{"NUM"} & \text{"0"} \\ aa.b & \text{"NUM"} & \text{"0"} \\ aa.c & \text{"NUM"} & \text{"0"} \end{bmatrix}$
CopyVar <i>aa.,bb.</i>	Done
getVarInfo()	$\begin{bmatrix} aa.a & \text{"NUM"} & \text{"0"} \\ aa.b & \text{"NUM"} & \text{"0"} \\ aa.c & \text{"NUM"} & \text{"0"} \\ bb.a & \text{"NUM"} & \text{"0"} \\ bb.b & \text{"NUM"} & \text{"0"} \\ bb.c & \text{"NUM"} & \text{"0"} \end{bmatrix}$

corrMat()

Catalog > 

corrMat(*List1*,*List2*[,...[,*List20*]])

Computes the correlation matrix for the augmented matrix [*List1*, *List2*, ..., *List20*].

cos()

 **key**

cos(*Value1*) $\Rightarrow$ *value*

cos(*List1*) $\Rightarrow$ *list*

cos(*Value1*) returns the cosine of the argument as a value.

cos(*List1*) returns a list of the cosines of all elements in *List1*.

Note: The argument is interpreted as a degree, gradian or radian angle, according to the current angle mode setting. You can use $^{\circ}$, $^{\circ}$, or $^{\circ}$ to override the angle mode temporarily.

In Degree angle mode:

$\cos\left(\left(\frac{\pi}{4}\right)^{\circ}\right)$	0.707107
$\cos(45)$	0.707107
$\cos(\{0,60,90\})$	$\{1.,0.5,0.\}$

In Gradian angle mode:

$\cos(\{0,50,100\})$	$\{1.,0.707107,0.\}$
----------------------	----------------------

In Radian angle mode:

$\cos\left(\frac{\pi}{4}\right)$	0.707107
$\cos(45^{\circ})$	0.707107

cos() **key****cos**(*squareMatrix1*) $\Rightarrow$ *squareMatrix*Returns the matrix cosine of *squareMatrix1*. This is not the same as calculating the cosine of each element.When a scalar function $f(A)$ operates on *squareMatrix1* (A), the result is calculated by the algorithm:Compute the eigenvalues (λ_i) and eigenvectors (V_i) of A .*squareMatrix1* must be diagonalizable. Also, it cannot have symbolic variables that have not been assigned a value.

Form the matrices:

$$B = \begin{bmatrix} \lambda_1 & 0 & \dots & 0 \\ 0 & \lambda_2 & \dots & 0 \\ 0 & 0 & \dots & 0 \\ 0 & 0 & \dots & \lambda_n \end{bmatrix} \text{ and } X = [V_1, V_2, \dots, V_n]$$

Then $A = X B X^{-1}$ and $f(A) = X f(B) X^{-1}$. For example, $\cos(A) = X \cos(B) X^{-1}$ where: $\cos(B) =$

$$\begin{bmatrix} \cos(\lambda_1) & 0 & \dots & 0 \\ 0 & \cos(\lambda_2) & \dots & 0 \\ 0 & 0 & \dots & 0 \\ 0 & 0 & \dots & \cos(\lambda_n) \end{bmatrix}$$

All computations are performed using floating-point arithmetic.

In Radian angle mode:

$$\cos \left(\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix} \right) = \begin{bmatrix} 0.212493 & 0.205064 & 0.121389 \\ 0.160871 & 0.259042 & 0.037126 \\ 0.248079 & -0.090153 & 0.218972 \end{bmatrix}$$

cos⁻¹() **key****cos⁻¹**(*Value1*) $\Rightarrow$ *value***cos⁻¹**(*List1*) $\Rightarrow$ *list***cos⁻¹**(*Value1*) returns the angle whose cosine is *Value1*.**cos⁻¹**(*List1*) returns a list of the inverse cosines of each element of *List1*.**Note:** The result is returned as a degree, gradian or radian angle, according to the current angle mode setting.**Note:** You can insert this function from the keyboard by typing **arccos**(...).**cos⁻¹**(*squareMatrix1*) $\Rightarrow$ *squareMatrix*Returns the matrix inverse cosine of *squareMatrix1*. This is not the same as calculating the inverse cosine of each element. For information about the calculation method, refer to **cos()**.*squareMatrix1* must be diagonalizable. The result always contains floating-point numbers.

In Degree angle mode:

$$\cos^{-1}(1) = 0$$

In Gradian angle mode:

$$\cos^{-1}(0) = 100$$

In Radian angle mode:

$$\cos^{-1}(\{0, 0.2, 0.5\}) = \{1.5708, 1.36944, 1.0472\}$$

In Radian angle mode and Rectangular Complex Format:

$$\cos^{-1} \left(\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix} \right) = \begin{bmatrix} 1.73485+0.064606 \cdot i & -1.49086+2.10514 \\ -0.725533+1.51594 \cdot i & 0.623491+0.77836 \cdot i \\ -2.08316+2.63205 \cdot i & 1.79018-1.27182 \cdot i \end{bmatrix}$$

To see the entire result, press $\blacktriangle$ and then use $\blacktriangleleft$ and $\blacktriangleright$ to move the cursor.

cosh()Catalog > **cosh**(*Value1*) $\Rightarrow$ *value***cosh**(*List1*) $\Rightarrow$ *list***cosh**(*Value1*) returns the hyperbolic cosine of the argument.**cosh**(*List1*) returns a list of the hyperbolic cosines of each element of *List1*.**cosh**(*squareMatrix1*) $\Rightarrow$ *squareMatrix*Returns the matrix hyperbolic cosine of *squareMatrix1*. $$\cosh^{-1}(1) \quad 0$$

$$\cosh^{-1}(\{1, 2, 1, 3\}) \quad \{0, 1.37286, \cosh^{-1}(3)\}$$

In Radian angle mode and In Rectangular Complex Format:

$$\cosh^{-1}\begin{pmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{pmatrix} \begin{bmatrix} 2.52503+1.73485\cdot i & -0.009241-1.4908i \\ 0.486969-0.725533\cdot i & 1.66262+0.623491i \\ -0.322354-2.08316\cdot i & 1.26707+1.79018i \end{bmatrix}$$

To see the entire result, press $\blacktriangle$ and then use $\blacktriangleleft$ and $\blacktriangleright$ to move the cursor.**cot()** **key****cot**(*Value1*) $\Rightarrow$ *value***cot**(*List1*) $\Rightarrow$ *list*Returns the cotangent of *Value1* or returns a list of the cotangents of all elements in *List1*.**Note:** The argument is interpreted as a degree, gradian or radian angle, according to the current angle mode setting. You can use $^\circ$, g , or r to override the angle mode temporarily.

In Degree angle mode:

$$\cot(45) \quad 1$$

In Gradian angle mode:

$$\cot(50) \quad 1$$

In Radian angle mode:

$$\cot(\{1, 2, 1, 3\}) \quad \{0.642093, -0.584848, -7.01525\}$$

cot⁻¹()	 key
cot⁻¹(Value1) $\Rightarrow$ <i>value</i>	
cot⁻¹(List1) $\Rightarrow$ <i>list</i>	
Returns the angle whose cotangent is <i>Value1</i> or returns a list containing the inverse cotangents of each element of <i>List1</i> .	
Note: The result is returned as a degree, gradian or radian angle, according to the current angle mode setting.	
Note: You can insert this function from the keyboard by typing arccot (...) .	
	In Degree angle mode:
	$\text{cot}^{-1}(1)$ 45
	In Gradian angle mode:
	$\text{cot}^{-1}(1)$ 50
	In Radian angle mode:
	$\text{cot}^{-1}(1)$.785398

coth()	Catalog > 
coth(Value1) $\Rightarrow$ <i>value</i>	
coth(List1) $\Rightarrow$ <i>list</i>	
Returns the hyperbolic cotangent of <i>Value1</i> or returns a list of the hyperbolic cotangents of all elements of <i>List1</i> .	
	$\text{coth}(1.2)$ 1.19954
	$\text{coth}(\{1,3,2\})$ { 1.31304,1.00333 }

coth⁻¹()	Catalog > 
coth⁻¹(Value1) $\Rightarrow$ <i>value</i>	
coth⁻¹(List1) $\Rightarrow$ <i>list</i>	
Returns the inverse hyperbolic cotangent of <i>Value1</i> or returns a list containing the inverse hyperbolic cotangents of each element of <i>List1</i> .	
Note: You can insert this function from the keyboard by typing arccoth (...) .	
	$\text{coth}^{-1}(3.5)$ 0.293893
	$\text{coth}^{-1}(\{-2,2,1,6\})$ { -0.549306,0.518046,0.168236 }

count()	Catalog > 
count(Value1orList1 [,Value2orList2 [...]]) $\Rightarrow$ <i>value</i>	
Returns the accumulated count of all elements in the arguments that evaluate to numeric values.	
Each argument can be an expression, value, list, or matrix. You can mix data types and use arguments of various dimensions.	
For a list, matrix, or range of cells, each element is evaluated to determine if it should be included in the count.	
Within the Lists & Spreadsheet application, you can use a range of cells in place of any argument.	
Empty (void) elements are ignored. For more information on empty elements, see page 132.	
	$\text{count}(2,4,6)$ 3
	$\text{count}(\{2,4,6\})$ 3
	$\text{count}\left(2,\{4,6\},\begin{bmatrix} 8 & 10 \\ 12 & 14 \end{bmatrix}\right)$ 7

countif()Catalog > **countif**(*List*, *Criteria*) $\Rightarrow$ *value*Returns the accumulated count of all elements in *List* that meet the specified *Criteria*.*Criteria* can be:

- A value, expression, or string. For example, **3** counts only those elements in *List* that simplify to the value 3.
- A Boolean expression containing the symbol **?** as a placeholder for each element. For example, **?<5** counts only those elements in *List* that are less than 5.

Within the Lists & Spreadsheet application, you can use a range of cells in place of *List*.

Empty (void) elements in the list are ignored. For more information on empty elements, see page 132.

Note: See also **sumIf()**, page 101, and **frequency()**, page 39.

countIf ($\{1, 3, "abc", \text{undef}, 3, 1\}, 3\}$)	2
---	---

Counts the number of elements equal to 3.

countIf ($\{ "abc", "def", "abc", 3\}, "def"$)	1
---	---

Counts the number of elements equal to "def."

countIf ($\{1, 3, 5, 7, 9\}, ? < 5\}$)	2
---	---

Counts 1 and 3.

countIf ($\{1, 3, 5, 7, 9\}, 2 < ? < 8\}$)	3
---	---

Counts 3, 5, and 7.

countIf ($\{1, 3, 5, 7, 9\}, ? < 4 \text{ or } ? > 6\}$)	4
---	---

Counts 1, 3, 7, and 9.

cPolyRoots()Catalog > **cPolyRoots**(*Poly*, *Var*) $\Rightarrow$ *list***cPolyRoots**(*ListOfCoeffs*) $\Rightarrow$ *list*The first syntax, **cPolyRoots**(*Poly*, *Var*), returns a list of complex roots of polynomial *Poly* with respect to variable *Var*.*Poly* must be a polynomial in expanded form in one variable. Do not use unexpanded forms such as $y^2 \cdot y + 1$ or $x \cdot x + 2 \cdot x + 1$.The second syntax, **cPolyRoots**(*ListOfCoeffs*), returns a list of complex roots for the coefficients in *ListOfCoeffs*.**Note:** See also **polyRoots()**, page 75.

polyRoots ($y^3 + 1, y$)	$\{-1\}$
-----------------------------------	----------

cPolyRoots ($y^3 + 1, y$)	$\{-1, 0.5 - 0.866025i, 0.5 + 0.866025i\}$

CubicReg $X, Y, [Freq], [Category, Include]$

Computes the cubic polynomial regression $y = a \cdot x^3 + b \cdot x^2 + c \cdot x + d$ on lists X and Y with frequency $Freq$. A summary of results is stored in the *stat.results* variable. (See page 98.)

All the lists must have equal dimension except for *Include*.

X and Y are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding X and Y data point. The default value is 1. All elements must be integers ≥ 0 .

Category is a list of numeric or string category codes for the corresponding X and Y data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.RegEqn	Regression equation: $a \cdot x^3 + b \cdot x^2 + c \cdot x + d$
stat.a, stat.b, stat.c, stat.d	Regression coefficients
stat.R ²	Coefficient of determination
stat.Resid	Residuals from the regression
stat.XReg	List of data points in the modified X List actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.YReg	List of data points in the modified Y List actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.FreqReg	List of frequencies corresponding to <i>stat.XReg</i> and <i>stat.YReg</i>

cumulativeSum()

cumulativeSum(*List1*) $\Rightarrow$ *list*

Returns a list of the cumulative sums of the elements in *List1*, starting at element 1.

$$\text{cumulativeSum}\{1, 2, 3, 4\} \quad \{1, 3, 6, 10\}$$

cumulativeSum(*Matrix1*) $\Rightarrow$ *matrix*

Returns a matrix of the cumulative sums of the elements in *Matrix1*. Each element is the cumulative sum of the column from top to bottom.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix} \rightarrow m1 \quad \begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix}$$

An empty (void) element in *List1* or *Matrix1* produces a void element in the resulting list or matrix. For more information on empty elements, see page 132.

$$\text{cumulativeSum}(m1) \quad \begin{bmatrix} 1 & 2 \\ 4 & 6 \\ 9 & 12 \end{bmatrix}$$

Cycle	Catalog >
Cycle Transfers control immediately to the next iteration of the current loop (For, While, or Loop). Cycle is not allowed outside the three looping structures (For, While, or Loop). Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing instead of at the end of each line. On the computer keyboard, hold down Alt and press Enter.	Function listing that sums the integers from 1 to 100 skipping 50. Define $g()$=Func Local $temp,i$ $0 \rightarrow temp$ For $i,1,100,1$ If $i=50$ Cycle $temp+i \rightarrow temp$ EndFor Return $temp$ EndFunc Done $g()$ 5000

Cylind	Catalog >
Vector Cylind Note: You can insert this operator from the computer keyboard by typing @>Cylind. Displays the row or column vector in cylindrical form $[r,\angle\theta,z]$. Vector must have exactly three elements. It can be either a row or a column.	$\begin{bmatrix} 2 & 2 & 3 \end{bmatrix}$ Cylind 2.82843 $\angle 0.785398$ 3.

D

dbd()	Catalog >								
dbd(date1,date2) $\Rightarrow$ value Returns the number of days between <i>date1</i> and <i>date2</i> using the actual-day-count method. <i>date1</i> and <i>date2</i> can be numbers or lists of numbers within the range of the dates on the standard calendar. If both <i>date1</i> and <i>date2</i> are lists, they must be the same length. <i>date1</i> and <i>date2</i> must be between the years 1950 through 2049. You can enter the dates in either of two formats. The decimal placement differentiates between the date formats. MM.DDYY (format used commonly in the United States) DDMM.YY (format use commonly in Europe)	<table> <tr> <td>dbd(12.3103,1.0104)</td><td>1</td></tr> <tr> <td>dbd(1.0107,6.0107)</td><td>151</td></tr> <tr> <td>dbd(3112.03,101.04)</td><td>1</td></tr> <tr> <td>dbd(101.07,106.07)</td><td>151</td></tr> </table>	dbd(12.3103,1.0104)	1	dbd(1.0107,6.0107)	151	dbd(3112.03,101.04)	1	dbd(101.07,106.07)	151

►DD

Catalog >

Expr1 ►DD $\Rightarrow$ value

List1 ►DD $\Rightarrow$ list

Matrix1 ►DD $\Rightarrow$ matrix

Note: You can insert this operator from the computer keyboard by typing @>DD.

Returns the decimal equivalent of the argument expressed in degrees. The argument is a number, list, or matrix that is interpreted by the Angle mode setting in gradians, radians or degrees.

In Degree angle mode:

$\{1.5^\circ\}$ ►DD	1.5°
$\{45^\circ 22' 14.3''\}$ ►DD	45.3706°
$\{\{45^\circ 22' 14.3'', 60^\circ 0' 0''\}\}$ ►DD	$\{45.3706^\circ, 60^\circ\}$

In Gradian angle mode:

1 ►DD	$\frac{9}{10}^\circ$
-------	----------------------

In Radian angle mode:

$\{1.5\}$ ►DD	85.9437°
---------------	----------

►Decimal

Catalog >

Number1 ►Decimal $\Rightarrow$ value

List1 ►Decimal $\Rightarrow$ value

Matrix1 ►Decimal $\Rightarrow$ value

Note: You can insert this operator from the computer keyboard by typing @>Decimal.

Displays the argument in decimal form. This operator can be used only at the end of the entry line.

$\frac{1}{3}$ ►Decimal	0.333333
------------------------	----------

Define

Catalog >

Define Var = Expression

Define Function(Param1, Param2, ...) = Expression

Defines the variable Var or the user-defined function Function.

Parameters, such as Param1, provide placeholders for passing arguments to the function. When calling a user-defined function, you must supply arguments (for example, values or variables) that correspond to the parameters. When called, the function evaluates Expression using the supplied arguments.

Var and Function cannot be the name of a system variable or built-in function or command.

Note: This form of **Define** is equivalent to executing the expression: expression $\rightarrow$ Function(Param1, Param2).

Define $g(x,y)=2 \cdot x-3 \cdot y$	Done
$g(1,2)$	-4
$1 \rightarrow a: 2 \rightarrow b: g(a,b)$	-4
Define $h(x)=\text{when}(x<2, 2 \cdot x-3, -2 \cdot x+3)$	Done
$h(-3)$	-9
$h(4)$	-5

DefineCatalog > **Define Function**(Param1, Param2, ...) = **Func***Block***EndFunc****Define Program**(Param1, Param2, ...) = **Prgm***Block***EndPrgm**

In this form, the user-defined function or program can execute a block of multiple statements.

Block can be either a single statement or a series of statements on separate lines. *Block* also can include expressions and instructions (such as **If**, **Then**, **Else**, and **For**).

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing  instead of  at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

Note: See also **Define LibPriv**, page 28, and **Define LibPub**, page 28.

Define $g(x,y)=\text{Func}$

Done

If $x>y$ ThenReturn x

Else

Return y

EndIf

EndFunc

 $g(3,-7)$

3

Define $g(x,y)=\text{Prgm}$ If $x>y$ ThenDisp x , " greater than ", y

Else

Disp x , " not greater than ", y

EndIf

EndPrgm

Done

 $g(3,-7)$

3 greater than -7

Done

Define LibPrivCatalog > **Define LibPriv** Var = Expression**Define LibPriv** Function(Param1, Param2, ...) = Expression**Define LibPriv** Function(Param1, Param2, ...) = **Func***Block***EndFunc****Define LibPriv** Program(Param1, Param2, ...) = **Prgm***Block***EndPrgm**

Operates the same as **Define**, except defines a private library variable, function, or program. Private functions and programs do not appear in the Catalog.

Note: See also **Define**, page 27, and **Define LibPub**, page 28.

Define LibPubCatalog > **Define LibPub** Var = Expression**Define LibPub** Function(Param1, Param2, ...) = Expression**Define LibPub** Function(Param1, Param2, ...) = **Func***Block***EndFunc****Define LibPub** Program(Param1, Param2, ...) = **Prgm***Block***EndPrgm**

Operates the same as **Define**, except defines a public library variable, function, or program. Public functions and programs appear in the Catalog after the library has been saved and refreshed.

Note: See also **Define**, page 27, and **Define LibPriv**, page 28.

DelVar

Catalog > **DelVar** *Var1* [, *Var2*] [, *Var3*] ...**DelVar** *Var*.

Deletes the specified variable or variable group from memory.

If one or more of the variables are locked, this command displays an error message and deletes only the unlocked variables. See **unLock**, page 110.

DelVar *Var*. deletes all members of the *Var*. variable group (such as the statistics *stat.nn* results or variables created using the **LibShortcut()** function). The dot (.) in this form of the **DelVar** command limits it to deleting a variable group; the simple variable *Var* is not affected.

$2 \rightarrow a$	2									
$(a+2)^2$	16									
DelVar <i>a</i>	Done									
$(a+2)^2$	"Error: Variable is not defined"									
<i>aa.a</i> :=45	45

<i>aa.c</i> :=78.9	78.9									
getVarInfo()	<table><tr><td><i>aa.a</i></td><td>"NUM"</td><td></td></tr><tr><td><i>aa.b</i></td><td>"NUM"</td><td></td></tr><tr><td><i>aa.c</i></td><td>"NUM"</td><td></td></tr></table>	<i>aa.a</i>	"NUM"		<i>aa.b</i>	"NUM"		<i>aa.c</i>	"NUM"	
<i>aa.a</i>	"NUM"									
<i>aa.b</i>	"NUM"									
<i>aa.c</i>	"NUM"									
DelVar <i>aa</i> .	Done									
getVarInfo()	"NONE"									

delVoid()

Catalog > **delVoid**(*List1*) $\Rightarrow$ *list*

Returns a list that has the contents of *List1* with all empty (void) elements removed.

For more information on empty elements, see page 132.

$\text{delVoid}(\{1, \text{void}, 3\})$	$\{1, 3\}$
---	------------

det()

Catalog > **det**(*squareMatrix* [, *Tolerance*]) $\Rightarrow$ *expression*

Returns the determinant of *squareMatrix*.

Optionally, any matrix element is treated as zero if its absolute value is less than *Tolerance*. This tolerance is used only if the matrix has floating-point entries and does not contain any symbolic variables that have not been assigned a value. Otherwise, *Tolerance* is ignored.

- If you use   or set the **Auto or Approximate** mode to Approximate, computations are done using floating-point arithmetic.
- If *Tolerance* is omitted or not used, the default tolerance is calculated as:

$$5E-14 \cdot \max(\text{dim}(\text{squareMatrix})) \cdot \text{rowNorm}(\text{squareMatrix})$$

$\det\left(\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}\right)$	-2
$\begin{bmatrix} 1. \text{E}20 & 1 \\ 0 & 1 \end{bmatrix} \rightarrow \text{mat1}$	$\begin{bmatrix} 1. \text{E}20 & 1 \\ 0 & 1 \end{bmatrix}$
$\det(\text{mat1})$	0
$\det(\text{mat1}, 1)$	1. E20

diag()		Catalog > 
diag(List) $\Rightarrow$ matrix		
diag(rowMatrix) $\Rightarrow$ matrix	$\text{diag}\left(\begin{bmatrix} 2 & 4 & 6 \end{bmatrix}\right)$	$\begin{bmatrix} 2 & 0 & 0 \\ 0 & 4 & 0 \\ 0 & 0 & 6 \end{bmatrix}$
diag(columnMatrix) $\Rightarrow$ matrix		
Returns a matrix with the values in the argument list or matrix in its main diagonal.		
diag(squareMatrix) $\Rightarrow$ rowMatrix		
Returns a row matrix containing the elements from the main diagonal of squareMatrix.	$\begin{bmatrix} 4 & 6 & 8 \\ 1 & 2 & 3 \\ 5 & 7 & 9 \end{bmatrix}$	$\begin{bmatrix} 4 & 6 & 8 \\ 1 & 2 & 3 \\ 5 & 7 & 9 \end{bmatrix}$
squareMatrix must be square.	$\text{diag}(\text{Ans})$	$\begin{bmatrix} 4 & 2 & 9 \end{bmatrix}$

dim()		Catalog > 
dim(List) $\Rightarrow$ integer		
Returns the dimension of List.	$\text{dim}\left(\{0,1,2\}\right)$	3
dim(Matrix) $\Rightarrow$ list		
Returns the dimensions of matrix as a two-element list {rows, columns}.	$\text{dim}\left(\begin{bmatrix} 1 & -1 \\ 2 & -2 \\ 3 & 5 \end{bmatrix}\right)$	$\{3,2\}$
dim(String) $\Rightarrow$ integer		
Returns the number of characters contained in character string String.	$\text{dim}(\text{"Hello"})$	5
	$\text{dim}(\text{"Hello " \& "there"})$	11

Disp		Catalog > 
Disp [exprOrString1] [, exprOrString2] ...		
Displays the arguments in the Calculator history. The arguments are displayed in succession, with thin spaces as separators.	Define $\text{chars}(\text{start},\text{end})=\text{Prgm}$	
Useful mainly in programs and functions to ensure the display of intermediate calculations.	For $i,\text{start},\text{end}$	
Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing  instead of  at the end of each line. On the computer keyboard, hold down Alt and press Enter .	Disp $i,$ " ",char(i)	
	EndFor	
	EndPrgm	
		Done
	$\text{chars}(240,243)$	
		240 ð
		241 ñ
		242 ò
		243 ó
		Done

DMS

Catalog > 

Value **DMS**

List **DMS**

Matrix **DMS**

Note: You can insert this operator from the computer keyboard by typing **@DMS**.

Interprets the argument as an angle and displays the equivalent DMS (DDDDDD°MM'SS.ss") number. See °, ', "" on page 128 for DMS (degree, minutes, seconds) format.

Note: **DMS** will convert from radians to degrees when used in radian mode. If the input is followed by a degree symbol °, no conversion will occur. You can use **DMS** only at the end of an entry line.

In Degree angle mode:

$\{45.371\}$	DMS	$45^{\circ}22'15.6''$
$\{\{45.371,60\}\}$	DMS	$\{45^{\circ}22'15.6'',60^{\circ}\}$

dotP()

Catalog > 

dotP(List1, List2) $\Rightarrow$ expression

Returns the "dot" product of two lists.

$\text{dotP}(\{1,2\},\{5,6\})$	17
--------------------------------	----

dotP(Vector1, Vector2) $\Rightarrow$ expression

Returns the "dot" product of two vectors.

$\text{dotP}([1 \ 2 \ 3],[4 \ 5 \ 6])$	32
--	----

Both must be row vectors, or both must be column vectors.

E

e^()

 **key**

e^(Value1) $\Rightarrow$ value

Returns **e** raised to the Value1 power.

e^1	2.71828
-------	---------

Note: See also **e exponent template**, page 2.

e^3	8103.08
-------	---------

Note: Pressing  to display $e^{\wedge}()$ is different from pressing the character  on the keyboard.

You can enter a complex number in $re^{i\theta}$ polar form. However, use this form in Radian angle mode only; it causes a Domain error in Degree or Gradian angle mode.

e^(List1) $\Rightarrow$ list

Returns **e** raised to the power of each element in List1.

$e^{\{1,1.,0.5\}}$	$\{2.71828,2.71828,1.64872\}$
--------------------	-------------------------------

e^(squareMatrix1) $\Rightarrow$ squareMatrix

Returns the matrix exponential of squareMatrix1. This is not the same as calculating **e** raised to the power of each element. For information about the calculation method, refer to **cos()**.

$e^{\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}}$	$\begin{bmatrix} 782.209 & 559.617 & 456.509 \\ 680.546 & 488.795 & 396.521 \\ 524.929 & 371.222 & 307.879 \end{bmatrix}$
--	---

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

eff()Catalog > **eff**(nominalRate,CpY) $\Rightarrow$ value

Financial function that converts the nominal interest rate *nominalRate* to an annual effective rate, given *CpY* as the number of compounding periods per year.

nominalRate must be a real number, and *CpY* must be a real number > 0 .

Note: See also **nom()**, page 69.

eff(5.75,12)

5.90398

eigVc()Catalog > **eigVc**(squareMatrix) $\Rightarrow$ matrix

Returns a matrix containing the eigenvectors for a real or complex *squareMatrix*, where each column in the result corresponds to an eigenvalue. Note that an eigenvector is not unique; it may be scaled by any constant factor. The eigenvectors are normalized, meaning that if $V = [x_1, x_2, \dots, x_n]$, then:

$$x_1^2 + x_2^2 + \dots + x_n^2 = 1$$

squareMatrix is first balanced with similarity transformations until the row and column norms are as close to the same value as possible. The *squareMatrix* is then reduced to upper Hessenberg form and the eigenvectors are computed via a Schur factorization.

In Rectangular Complex Format:

$$\begin{bmatrix} -1 & 2 & 5 \\ 3 & -6 & 9 \\ 2 & -5 & 7 \end{bmatrix} \rightarrow mI \quad \begin{bmatrix} -1 & 2 & 5 \\ 3 & -6 & 9 \\ 2 & -5 & 7 \end{bmatrix}$$

$$\text{eigVc}(mI) \begin{bmatrix} -0.800906 & 0.767947 & (\\ 0.484029 & 0.573804+0.052258 \cdot i & 0.5738 \\ 0.352512 & 0.262687+0.096286 \cdot i & 0.2626 \end{bmatrix}$$

To see the entire result, press $\blacktriangle$ and then use $\blacktriangleleft$ and $\blacktriangleright$ to move the cursor.

eigVl()Catalog > **eigVl**(squareMatrix) $\Rightarrow$ list

Returns a list of the eigenvalues of a real or complex *squareMatrix*.

squareMatrix is first balanced with similarity transformations until the row and column norms are as close to the same value as possible. The *squareMatrix* is then reduced to upper Hessenberg form and the eigenvalues are computed from the upper Hessenberg matrix.

In Rectangular complex format mode:

$$\begin{bmatrix} -1 & 2 & 5 \\ 3 & -6 & 9 \\ 2 & -5 & 7 \end{bmatrix} \rightarrow mI \quad \begin{bmatrix} -1 & 2 & 5 \\ 3 & -6 & 9 \\ 2 & -5 & 7 \end{bmatrix}$$

$$\text{eigVl}(mI) \{ -4.40941, 2.20471+0.763006 \cdot i, 2.20471-0.763006 \cdot i \}$$

To see the entire result, press $\blacktriangle$ and then use $\blacktriangleleft$ and $\blacktriangleright$ to move the cursor.

Else

See If, page 45.

euler()

Catalog > 

euler(Expr, Var, depVar, {Var0 VarMax}, depVar0, VarStep
[, eulerStep]) $\Rightarrow$ matrix

euler(SystemOfExpr, Var, ListOfDepVars, {Var0, VarMax},
ListOfDepVars0, VarStep [, eulerStep]) $\Rightarrow$ matrix

euler(ListOfExpr, Var, ListOfDepVars, {Var0, VarMax},
ListOfDepVars0, VarStep [, eulerStep]) $\Rightarrow$ matrix

Uses the Euler method to solve the system

$$\frac{d \text{ depVar}}{d \text{ Var}} = \text{Expr}(\text{Var}, \text{depVar})$$

with $\text{depVar}(\text{Var0}) = \text{depVar0}$ on the interval $[\text{Var0}, \text{VarMax}]$. Returns a matrix whose first row defines the Var output values and whose second row defines the value of the first solution component at the corresponding Var values, and so on.

Expr is the right-hand side that defines the ordinary differential equation (ODE).

SystemOfExpr is the system of right-hand sides that define the system of ODEs (corresponds to order of dependent variables in ListOfDepVars).

ListOfExpr is a list of right-hand sides that define the system of ODEs (corresponds to the order of dependent variables in ListOfDepVars).

Var is the independent variable.

ListOfDepVars is a list of dependent variables.

{Var0, VarMax} is a two-element list that tells the function to integrate from Var0 to VarMax.

ListOfDepVars0 is a list of initial values for dependent variables.

VarStep is a nonzero number such that $\text{sign}(\text{VarStep}) = \text{sign}(\text{VarMax} - \text{Var0})$ and solutions are returned at $\text{Var0} + i \cdot \text{VarStep}$ for all $i = 0, 1, 2, \dots$ such that $\text{Var0} + i \cdot \text{VarStep}$ is in $[\text{Var0}, \text{VarMax}]$ (there may not be a solution value at VarMax).

eulerStep is a positive integer (defaults to 1) that defines the number of euler steps between output values. The actual step size used by the euler method is $\text{VarStep} / \text{eulerStep}$.

Differential equation:

$$y' = 0.001 \cdot y \cdot (100 - y) \text{ and } y(0) = 10$$

$$\text{euler}\{0.001 \cdot y \cdot (100 - y), t, y, \{0, 100\}, 10, 1\}$$

0.	1.	2.	3.	4.
10.	10.9	11.8712	12.9174	14.042

To see the entire result, press $\blacktriangle$ and then use $\blacktriangleleft$ and $\blacktriangleright$ to move the cursor.

System of equations:

$$\begin{cases} y1' = y1 + 0.1 \cdot y1 \cdot y2 \\ y2' = 3 \cdot y2 - y1 \cdot y2 \end{cases}$$

with $y1(0) = 2$ and $y2(0) = 5$

$$\text{euler}\left\{\begin{cases} y1 + 0.1 \cdot y1 \cdot y2 \\ 3 \cdot y2 - y1 \cdot y2 \end{cases}, t, \{y1, y2\}, \{0, 5\}, \{2, 5\}, 1\right\}$$

0.	1.	2.	3.	4.	5.
2.	1.	1.	3.	27.	243.
5.	10.	30.	90.	90.	-2070.

Exit

Catalog > 

Exit

Exits the current **For**, **While**, or **Loop** block.

Exit is not allowed outside the three looping structures (**For**, **While**, or **Loop**).

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing $\boxed{\text{Enter}}$

instead of $\boxed{\text{enter}}$ at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

Function listing:

```

Define g() = Func
    Local temp, i
    0  $\rightarrow$  temp
    For i, 1, 100, 1
        temp + i  $\rightarrow$  temp
    If temp  $\geq$  20 Then
        Exit
    EndIf
    EndFor
EndFunc
g()

```

Done

exp()	ex key		
exp(Value1) $\Rightarrow$ <i>value</i>			
Returns e raised to the <i>Value1</i> power.	e^1 2.71828		
Note: See also e exponent template, page 2.	e^3 8103.08		
You can enter a complex number in $re^{i\theta}$ polar form. However, use this form in Radian angle mode only; it causes a Domain error in Degree or Gradian angle mode.			
exp(List1) $\Rightarrow$ <i>list</i>			
Returns e raised to the power of each element in <i>List1</i> .	$e^{\{1,1,0.5\}}$ $\{2.71828, 2.71828, 1.64872\}$		
exp(squareMatrix1) $\Rightarrow$ <i>squareMatrix</i>			
Returns the matrix exponential of <i>squareMatrix1</i> . This is not the same as calculating e raised to the power of each element. For information about the calculation method, refer to cos() .	<table> <tr> <td>$e^{\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}}$</td> <td>$\begin{bmatrix} 782.209 & 559.617 & 456.509 \\ 680.546 & 488.795 & 396.521 \\ 524.929 & 371.222 & 307.879 \end{bmatrix}$</td> </tr> </table>	$e^{\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}}$	$\begin{bmatrix} 782.209 & 559.617 & 456.509 \\ 680.546 & 488.795 & 396.521 \\ 524.929 & 371.222 & 307.879 \end{bmatrix}$
$e^{\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}}$	$\begin{bmatrix} 782.209 & 559.617 & 456.509 \\ 680.546 & 488.795 & 396.521 \\ 524.929 & 371.222 & 307.879 \end{bmatrix}$		
<i>squareMatrix1</i> must be diagonalizable. The result always contains floating-point numbers.			

expr()	Catalog >
expr(String) $\Rightarrow$ <i>expression</i>	
Returns the character string contained in <i>String</i> as an expression and immediately executes it.	"Define cube(x)=x^3" $\rightarrow$ <i>funcstr</i> "Define cube(x)=x^3"
	$expr(funcstr)$ Done
	$cube(2)$ 8

ExpReg	Catalog >
ExpReg X, Y [, [Freq] [, Category, Include]]	
Computes the exponential regression $y = a \cdot (b)^x$ on lists <i>X</i> and <i>Y</i> with frequency <i>Freq</i> . A summary of results is stored in the <i>stat.results</i> variable. (See page 98.)	
All the lists must have equal dimension except for <i>Include</i> .	
<i>X</i> and <i>Y</i> are lists of independent and dependent variables.	
<i>Freq</i> is an optional list of frequency values. Each element in <i>Freq</i> specifies the frequency of occurrence for each corresponding <i>X</i> and <i>Y</i> data point. The default value is 1. All elements must be integers ≥ 0 .	
<i>Category</i> is a list of numeric or string category codes for the corresponding <i>X</i> and <i>Y</i> data.	
<i>Include</i> is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.	
For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.	

Output variable	Description
stat.RegEqn	Regression equation: $a \cdot (b)^x$
stat.a, stat.b	Regression coefficients
stat.r ²	Coefficient of linear determination for transformed data
stat.r	Correlation coefficient for transformed data ($x, \ln(y)$)

Output variable	Description
stat.Resid	Residuals associated with the exponential model
stat.ResidTrans	Residuals associated with linear fit of transformed data
stat.XReg	List of data points in the modified <i>X List</i> actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.YReg	List of data points in the modified <i>Y List</i> actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.FreqReg	List of frequencies corresponding to <i>stat.XReg</i> and <i>stat.YReg</i>

F

factor()

Catalog >

factor(*rationalNumber*) returns the rational number factored into primes. For composite numbers, the computing time grows exponentially with the number of digits in the second-largest factor. For example, factoring a 30-digit integer could take more than a day, and factoring a 100-digit number could take more than a century.

<code>factor(152417172689)</code>	123457·1234577
<code>isPrime(152417172689)</code>	false

To stop a calculation manually,

- **Windows®:** Hold down the **F12** key and press **Enter** repeatedly.
- **Macintosh®:** Hold down the **F5** key and press **Enter** repeatedly.
- **Handheld:** Hold down the key and press repeatedly.

If you merely want to determine if a number is prime, use **isPrime()** instead. It is much faster, particularly if *rationalNumber* is not prime and if the second-largest factor has more than five digits.

F Cdf()

Catalog >

F Cdf(*lowBound*, *upBound*, *dfNumer*, *dfDenom*) $\Rightarrow$ number if *lowBound* and *upBound* are numbers, list if *lowBound* and *upBound* are lists

FCdf(*lowBound*, *upBound*, *dfNumer*, *dfDenom*) $\Rightarrow$ number if *lowBound* and *upBound* are numbers, list if *lowBound* and *upBound* are lists

Computes the **F** distribution probability between *lowBound* and *upBound* for the specified *dfNumer* (degrees of freedom) and *dfDenom*.

For $P(X \leq upBound)$, set *lowBound* = 0.

Fill

Catalog >

Fill *Value*, *matrixVar* $\Rightarrow$ *matrix*

Replaces each element in variable *matrixVar* with *Value*.
matrixVar must already exist.

$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \rightarrow amatrix$	$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$
Fill 1.01, <i>amatrix</i>	Done
<i>amatrix</i>	$\begin{bmatrix} 1.01 & 1.01 \\ 1.01 & 1.01 \end{bmatrix}$

FillCatalog > **Fill** *Value*, *listVar* $\Rightarrow$ *list*Replaces each element in variable *listVar* with *Value*.*listVar* must already exist. $\{1,2,3,4,5\} \rightarrow alist$ $\{1,2,3,4,5\}$ Fill 1.01,*alist* Done*alist* $\{1.01,1.01,1.01,1.01,1.01\}$ **FiveNumSummary**Catalog > **FiveNumSummary** *X*, [*Freq*], [*Category*, *Include*]Provides an abbreviated version of the 1-variable statistics on list *X*.
A summary of results is stored in the *stat.results* variable. (See page 98.)*X* represents a list containing the data.*Freq* is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding *X* and *Y* data point. The default value is 1.*Category* is a list of numeric category codes for the corresponding *X* data.*Include* is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.An empty (void) element in any of the lists *X*, *Freq*, or *Category* results in a void for the corresponding element of all those lists. For more information on empty elements, see page 132.

Output variable	Description
stat.MinX	Minimum of x values.
stat.Q ₁ X	1st Quartile of x.
stat.MedianX	Median of x.
stat.Q ₃ X	3rd Quartile of x.
stat.MaxX	Maximum of x values.

floor()Catalog > **floor**(*Value1*) $\Rightarrow$ *integer*Returns the greatest integer that is $\leq$ the argument. This function is identical to **int()**.

The argument can be a real or a complex number.

floor(*List1*) $\Rightarrow$ *list***floor**(*Matrix1*) $\Rightarrow$ *matrix*

Returns a list or matrix of the floor of each element.

Note: See also **ceiling()** and **int()**. $\text{floor}(-2.14)$ -3. $\text{floor}\left(\left\{\frac{3}{2}, 0, -5.3\right\}\right)$ $\{1, 0, -6\}$ $\text{floor}\left(\begin{bmatrix} 1.2 & 3.4 \\ 2.5 & 4.8 \end{bmatrix}\right)$ $\begin{bmatrix} 1. & 3. \\ 2. & 4. \end{bmatrix}$

ForCatalog > **For** *Var*, *Low*, *High* [, *Step*]*Block***EndFor**

Executes the statements in *Block* iteratively for each value of *Var*, from *Low* to *High*, in increments of *Step*.

Var must not be a system variable.

Step can be positive or negative. The default value is 1.

Block can be either a single statement or a series of statements separated with the ":" character.

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing  instead of  at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

Define $g() = \text{Func}$

Done

Local *tempsum*, *step*, *i* $0 \rightarrow \text{tempsum}$ $1 \rightarrow \text{step}$ For *i*, 1, 100, *step**tempsum* + *i* $\rightarrow$ *tempsum*

EndFor

EndFunc

 $g()$

5050

format()Catalog > **format**(*Value* [, *formatString*]) $\Rightarrow$ *string*

Returns *Value* as a character string based on the format template.

formatString is a string and must be in the form: "F[n]", "S[n]", "E[n]", "G[n][c]", where [] indicate optional portions.

F[n]: Fixed format. n is the number of digits to display after the decimal point.

S[n]: Scientific format. n is the number of digits to display after the decimal point.

E[n]: Engineering format. n is the number of digits after the first significant digit. The exponent is adjusted to a multiple of three, and the decimal point is moved to the right by zero, one, or two digits.

G[n][c]: Same as fixed format but also separates digits to the left of the radix into groups of three. c specifies the group separator character and defaults to a comma. If c is a period, the radix will be shown as a comma.

[Rc]: Any of the above specifiers may be suffixed with the Rc radix flag, where c is a single character that specifies what to substitute for the radix point.

 $\text{format}(1.234567, "f3")$ "1.235" $\text{format}(1.234567, "s2")$ "1.23E0" $\text{format}(1.234567, "e3")$ "1.235E0" $\text{format}(1.234567, "g3")$ "1.235" $\text{format}(1234.567, "g3")$ "1,234.567" $\text{format}(1.234567, "g3,r:")$ "1:235"**fPart()**Catalog > **fPart**(*Expr1*) $\Rightarrow$ *expression***fPart**(*List1*) $\Rightarrow$ *list***fPart**(*Matrix1*) $\Rightarrow$ *matrix*

Returns the fractional part of the argument.

For a list or matrix, returns the fractional parts of the elements.

The argument can be a real or a complex number.

 $\text{fPart}(-1.234)$ -0.234 $\text{fPart}(\{1, -2.3, 7.003\})$ {0, -0.3, 0.003}**FPdf()**Catalog > 

Fpdf(*XVal*, *dfNumer*, *dfDenom*) $\Rightarrow$ *number* if *XVal* is a number, *list* if *XVal* is a list

Computes the **F** distribution probability at *XVal* for the specified *dfNumer* (degrees of freedom) and *dfDenom*.

freqTable►list()

Catalog >

freqTable►list(*List1*, *freqIntegerList*) $\Rightarrow$ *list*

Returns a list containing the elements from *List1* expanded according to the frequencies in *freqIntegerList*. This function can be used for building a frequency table for the Data & Statistics application.

List1 can be any valid list.

freqIntegerList must have the same dimension as *List1* and must contain non-negative integer elements only. Each element specifies the number of times the corresponding *List1* element will be repeated in the result list. A value of zero excludes the corresponding *List1* element.

Note: You can insert this function from the computer keyboard by typing **freqTable@>list** (...).

Empty (void) elements are ignored. For more information on empty elements, see page 132.

```
freqTable►list({1,2,3,4},{1,4,3,1})
               {1,2,2,2,2,3,3,3,4}
```

```
freqTable►list({1,2,3,4},{1,4,0,1})
               {1,2,2,2,2,4}
```

frequency()

Catalog >

frequency(*List1*, *binsList*) $\Rightarrow$ *list*

Returns a list containing counts of the elements in *List1*. The counts are based on ranges (bins) that you define in *binsList*.

If *binsList* is {b(1), b(2), ..., b(n)}, the specified ranges are { $? \leq b(1)$, $b(1) < ? \leq b(2)$, ..., $b(n-1) < ? \leq b(n)$, $b(n) > ?$ }. The resulting list is one element longer than *binsList*.

Each element of the result corresponds to the number of elements from *List1* that are in the range of that bin. Expressed in terms of the **countIf()** function, the result is {countIf(list, $? \leq b(1)$), countIf(list, $b(1) < ? \leq b(2)$), ..., countIf(list, $b(n-1) < ? \leq b(n)$), countIf(list, $b(n) > ?$)}.

Elements of *List1* that cannot be "placed in a bin" are ignored. Empty (void) elements are also ignored. For more information on empty elements, see page 132.

Within the Lists & Spreadsheet application, you can use a range of cells in place of both arguments.

Note: See also **countIf()**, page 23.

```
datalist={1,2,e,3,pi,4,5,6,"hello",7}
          {1,2,2.71828,3,3.14159,4,5,6,"hello",7}
```

```
frequency(datalist,{2.5,4.5})           {2,4,3}
```

Explanation of result:

2 elements from *Datalist* are ≤ 2.5

4 elements from *Datalist* are > 2.5 and ≤ 4.5

3 elements from *Datalist* are > 4.5

The element "hello" is a string and cannot be placed in any of the defined bins.

FTest_2Samp

Catalog >

FTest_2Samp *List1*, *List2*[, *Freq1*[, *Freq2*[, *HypoH*]]]**FTest_2Samp** *List1*, *List2*[, *Freq1*[, *Freq2*[, *HypoH*]]]

(Data list input)

FTest_2Samp *sx1*, *n1*, *sx2*, *n2*[, *HypoH*]**FTest_2Samp** *sx1*, *n1*, *sx2*, *n2*[, *HypoH*]

(Summary stats input)

Performs a two-sample **F** test. A summary of results is stored in the *stat.results* variable. (See page 98.)

For H_a : $\sigma_1 > \sigma_2$, set *HypoH*>0

For H_a : $\sigma_1 \neq \sigma_2$ (default), set *HypoH* =0

For H_a : $\sigma_1 < \sigma_2$, set *HypoH*<0

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.F	Calculated F statistic for the data sequence
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.dfNumerator	numerator degrees of freedom = $n_1 - 1$
stat.dfDenom	denominator degrees of freedom = $n_2 - 1$
stat.sx1, stat.sx2	Sample standard deviations of the data sequences in <i>List 1</i> and <i>List 2</i>
stat.x1_bar stat.x2_bar	Sample means of the data sequences in <i>List 1</i> and <i>List 2</i>
stat.n1, stat.n2	Size of the samples

Func

Catalog >

Func

Block
EndFunc

Template for creating a user-defined function.

Block can be a single statement, a series of statements separated with the ":" character, or a series of statements on separate lines. The function can use the **Return** instruction to return a specific result.

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing instead of **(enter)** at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

Define a piecewise function:

Define $g(x) = \text{Func}$

Done

```

If x<0 Then
Return 3*cos(x)
Else
Return 3-x
EndIf
EndFunc

```

Result of graphing $g(x)$

G

gcd()

Catalog >

$\text{gcd}(\text{Number1}, \text{Number2}) \Rightarrow \text{expression}$

Returns the greatest common divisor of the two arguments. The **gcd** of two fractions is the **gcd** of their numerators divided by the **lcm** of their denominators.

In Auto or Approximate mode, the **gcd** of fractional floating-point numbers is 1.0.

$\text{gcd}(\text{List1}, \text{List2}) \Rightarrow \text{list}$

Returns the greatest common divisors of the corresponding elements in *List1* and *List2*.

$\text{gcd}(\text{Matrix1}, \text{Matrix2}) \Rightarrow \text{matrix}$

Returns the greatest common divisors of the corresponding elements in *Matrix1* and *Matrix2*.

$\text{gcd}(18, 33)$

3

$\text{gcd}(\{12, 14, 16\}, \{9, 7, 5\})$

$\{3, 7, 1\}$

$\text{gcd}\left(\begin{bmatrix} 2 & 4 \\ 6 & 8 \end{bmatrix}, \begin{bmatrix} 4 & 8 \\ 12 & 16 \end{bmatrix}\right)$

$\begin{bmatrix} 2 & 4 \\ 6 & 8 \end{bmatrix}$

geomCdf()Catalog > 

geomCdf($p, lowBound, upBound$) $\Rightarrow$ number if $lowBound$ and $upBound$ are numbers, list if $lowBound$ and $upBound$ are lists

geomCdf($p, upBound$) for $P(1 \leq X \leq upBound) \Rightarrow$ number if $upBound$ is a number, list if $upBound$ is a list

Computes a cumulative geometric probability from $lowBound$ to $upBound$ with the specified probability of success p .

For $P(X \leq upBound)$, set $lowBound = 1$.

geomPdf()Catalog > 

geomPdf($p, XVal$) $\Rightarrow$ number if $XVal$ is a number, list if $XVal$ is a list

Computes a probability at $XVal$, the number of the trial on which the first success occurs, for the discrete geometric distribution with the specified probability of success p .

getDenom()Catalog > 

getDenom($Fraction1$) $\Rightarrow$ value

Transforms the argument into an expression having a reduced common denominator, and then returns its denominator.

$x:=5: y:=6$	6
--------------	---

$getDenom\left(\frac{x+2}{y-3}\right)$	3
--	---

$getDenom\left(\frac{2}{7}\right)$	7
------------------------------------	---

$getDenom\left(\frac{1}{x} + \frac{y^2+y}{y^2}\right)$	30
--	----

getLangInfo()Catalog > 

getLangInfo() $\Rightarrow$ string

Returns a string that corresponds to the short name of the currently active language. You can, for example, use it in a program or function to determine the current language.

English = "en"
 Danish = "da"
 German = "de"
 Finnish = "fi"
 French = "fr"
 Italian = "it"
 Dutch = "nl"
 Belgian Dutch = "nl_BE"
 Norwegian = "no"
 Portuguese = "pt"
 Spanish = "es"
 Swedish = "sv"

$getLangInfo()$	"en"
-----------------	------

getLockInfo()Catalog > **getLockInfo**(Var) $\Rightarrow$ value

Returns the current locked/unlocked state of variable Var.

value =0: Var is unlocked or does not exist.

value =1: Var is locked and cannot be modified or deleted.

See **Lock**, page 57, and **unLock**, page 110.

a:=65	65
Lock a	Done
getLockInfo(a)	1
a:=75	"Error: Variable is locked."
DelVar a	"Error: Variable is locked."
Unlock a	Done
a:=75	75
DelVar a	Done

getMode()Catalog > **getMode**(ModeNameInteger) $\Rightarrow$ value**getMode**(0) $\Rightarrow$ list**getMode**(ModeNameInteger) returns a value representing the current setting of the ModeNameInteger mode.**getMode**(0) returns a list containing number pairs. Each pair consists of a mode integer and a setting integer.

For a listing of the modes and their settings, refer to the table below.

If you save the settings with **getMode**(0) $\rightarrow$ var, you can use **setMode**(var) in a function or program to temporarily restore the settings within the execution of the function or program only. See **setMode**(), page 91.

getMode(0)	{ 1,1,2,1,3,1,4,1,5,1,6,1,7,1 }
getMode(1)	1
getMode(7)	1

Mode Name	Mode Integer	Setting Integers
Display Digits	1	1=Float, 2=Float1, 3=Float2, 4=Float3, 5=Float4, 6=Float5, 7=Float6, 8=Float7, 9=Float8, 10=Float9, 11=Float10, 12=Float11, 13=Float12, 14=Fix0, 15=Fix1, 16=Fix2, 17=Fix3, 18=Fix4, 19=Fix5, 20=Fix6, 21=Fix7, 22=Fix8, 23=Fix9, 24=Fix10, 25=Fix11, 26=Fix12
Angle	2	1=Radian, 2=Degree, 3=Gradian
Exponential Format	3	1=Normal, 2=Scientific, 3=Engineering
Real or Complex	4	1=Real, 2=Rectangular, 3=Polar
Auto or Approx.	5	1=Auto, 2=Approximate
Vector Format	6	1=Rectangular, 2=Cylindrical, 3=Spherical
Base	7	1=Decimal, 2=Hex, 3=Binary

getNum()Catalog > **getNum(Fraction1)** $\Rightarrow$ value

Transforms the argument into an expression having a reduced common denominator, and then returns its numerator.

$x:=5; y:=6$	6
$\text{getNum}\left(\frac{x+2}{y-3}\right)$	7
$\text{getNum}\left(\frac{2}{7}\right)$	2
$\text{getNum}\left(\frac{1}{x} + \frac{1}{y}\right)$	11

getType()Catalog > **getType(var)** $\Rightarrow$ string

Returns a string that indicates the data type of variable var.

If var has not been defined, returns the string "NONE".

$\{1,2,3\} \rightarrow temp$	$\{1,2,3\}$
$\text{getType}(temp)$	"LIST"
$2:3 \cdot i \rightarrow temp$	$3 \cdot i$
$\text{getType}(temp)$	"EXPR"
$\text{DelVar } temp$	Done
$\text{getType}(temp)$	"NONE"

getVarInfo()Catalog > **getVarInfo()** $\Rightarrow$ matrix or string**getVarInfo(LibNameString)** $\Rightarrow$ matrix or string**getVarInfo()** returns a matrix of information (variable name, type, library accessibility, and locked/unlocked state) for all variables and library objects defined in the current problem.If no variables are defined, **getVarInfo()** returns the string "NONE".**getVarInfo(LibNameString)** returns a matrix of information for all library objects defined in library LibNameString. LibNameString must be a string (text enclosed in quotation marks) or a string variable.

If the library LibNameString does not exist, an error occurs.

$\text{getVarInfo}()$	"NONE"
Define $x=5$	Done
Lock x	Done
Define LibPriv $y=\{1,2,3\}$	Done
Define LibPub $z\{x\}=3 \cdot x^2 - x$	Done
$\text{getVarInfo}()$	$\begin{bmatrix} x & \text{"NUM"} & \text{"{ }"} & 1 \\ y & \text{"LIST"} & \text{"LibPriv"} & 0 \\ z & \text{"FUNC"} & \text{"LibPub"} & 0 \end{bmatrix}$
$\text{getVarInfo}(tmp3)$	"Error: Argument must be a string"
$\text{getVarInfo}(\text{"tmp3"})$	$\begin{bmatrix} volcy12 & \text{"NONE"} & \text{"LibPub"} & 0 \end{bmatrix}$

getVarInfo()

Catalog > 

Note the example, in which the result of **getVarInfo()** is assigned to variable *vs*. Attempting to display row 2 or row 3 of *vs* returns an "Invalid list or matrix" error because at least one of elements in those rows (variable *b*, for example) reevaluates to a matrix.

This error could also occur when using *Ans* to reevaluate a **getVarInfo()** result.

The system gives the above error because the current version of the software does not support a generalized matrix structure where an element of a matrix can be either a matrix or a list.

$a:=1$	1												
$b:=\begin{bmatrix} 1 & 2 \end{bmatrix}$	$\begin{bmatrix} 1 & 2 \end{bmatrix}$												
$c:=\begin{bmatrix} 1 & 3 & 7 \end{bmatrix}$	$\begin{bmatrix} 1 & 3 & 7 \end{bmatrix}$												
$vs:=\text{getVarInfo}()$	<table><tr><td>a</td><td>"NUM"</td><td>$\begin{bmatrix} \cdot & \cdot & \cdot \end{bmatrix}$</td><td>0</td></tr><tr><td>b</td><td>"MAT"</td><td>$\begin{bmatrix} \cdot & \cdot & \cdot \end{bmatrix}$</td><td>0</td></tr><tr><td>c</td><td>"MAT"</td><td>$\begin{bmatrix} \cdot & \cdot & \cdot \end{bmatrix}$</td><td>0</td></tr></table>	a	"NUM"	$\begin{bmatrix} \cdot & \cdot & \cdot \end{bmatrix}$	0	b	"MAT"	$\begin{bmatrix} \cdot & \cdot & \cdot \end{bmatrix}$	0	c	"MAT"	$\begin{bmatrix} \cdot & \cdot & \cdot \end{bmatrix}$	0
a	"NUM"	$\begin{bmatrix} \cdot & \cdot & \cdot \end{bmatrix}$	0										
b	"MAT"	$\begin{bmatrix} \cdot & \cdot & \cdot \end{bmatrix}$	0										
c	"MAT"	$\begin{bmatrix} \cdot & \cdot & \cdot \end{bmatrix}$	0										
$vs[1]$	$\begin{bmatrix} 1 & \text{"NUM"} & \begin{bmatrix} \cdot & \cdot & \cdot \end{bmatrix} & 0 \end{bmatrix}$												
$vs[1,1]$	1												
$vs[2]$	"Error: Invalid list or matrix"												
$vs[2,1]$	$\begin{bmatrix} 1 & 2 \end{bmatrix}$												

Goto

Catalog > 

Goto *labelName*

Transfers control to the label *labelName*.

labelName must be defined in the same function using a **Lbl** instruction.

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing  instead of **enter** at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

Define $g()$ = Func	Done
Local <i>temp, i</i>	
$0 \rightarrow temp$	
$1 \rightarrow i$	
Lbl <i>top</i>	
$temp + i \rightarrow temp$	
If $i < 10$ Then	
$i + 1 \rightarrow i$	
Goto <i>top</i>	
EndIf	
Return <i>temp</i>	
EndFunc	
$g()$	55

►Grad

Catalog > 

Expr1 ► **Grad** $\Rightarrow$ *expression*

Converts *Expr1* to gradian angle measure.

Note: You can insert this operator from the computer keyboard by typing **@>Grad**.

In Degree angle mode:

$(1.5) \blacktriangleright \text{Grad}$	$(1.66667)^{\circ}$
---	---------------------

In Radian angle mode:

$(1.5) \blacktriangleright \text{Grad}$	$(95.493)^{\circ}$
---	--------------------

identity()Catalog > **identity(Integer)** $\Rightarrow$ matrixReturns the identity matrix with a dimension of *Integer*.*Integer* must be a positive integer.

identity(4)	1	0	0	0
	0	1	0	0
	0	0	1	0
	0	0	0	1

IfCatalog > **If** *BooleanExpr*
*Statement*Define $g(x) = \text{Func}$ Done**If** *BooleanExpr* **Then**
*Block*If $x < 0$ ThenReturn x^2

EndIf

EndFunc

EndIfIf *BooleanExpr* evaluates to true, executes the single statement *Statement* or the block of statements *Block* before continuing execution. $g(-2)$ 4If *BooleanExpr* evaluates to false, continues execution without executing the statement or block of statements.*Block* can be either a single statement or a sequence of statements separated with the ":" character.**Note for entering the example:** In the Calculator application on the handheld, you can enter multi-line definitions by pressing instead of  at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.**If** *BooleanExpr* **Then**
*Block1*Define $g(x) = \text{Func}$ Done**Else**
*Block2*If $x < 0$ ThenReturn $-x$

Else

Return x

EndIf

EndFunc

EndIfIf *BooleanExpr* evaluates to true, executes *Block1* and then skips *Block2*.If *BooleanExpr* evaluates to false, skips *Block1* but executes *Block2*.*Block1* and *Block2* can be a single statement. $g(12)$ 12 $g(-12)$ 12

If *BooleanExpr1* **Then**
 Block1
Elseif *BooleanExpr2* **Then**
 Block2
 ⋮
Elseif *BooleanExprN* **Then**
 BlockN
Endif

Allows for branching. If *BooleanExpr1* evaluates to true, executes *Block1*. If *BooleanExpr1* evaluates to false, evaluates *BooleanExpr2*, and so on.

```
Define g(x)=Func
    If x<5 Then
        Return 5
    ElseIf x>5 and x<0 Then
        Return -x
    ElseIf x≥0 and x≠10 Then
        Return x
    ElseIf x=10 Then
        Return 3
    EndIf
EndFunc
```

Done

$g(-4)$	4
$g(10)$	3

ifFn()

ifFn(*BooleanExpr*, *Value_If_true* [, *Value_If_false* [, *Value_If_unknown*]]) $\Rightarrow$ *expression, list, or matrix*

Evaluates the boolean expression *BooleanExpr* (or each element from *BooleanExpr*) and produces a result based on the following rules:

- BooleanExpr* can test a single value, a list, or a matrix.
- If an element of *BooleanExpr* evaluates to true, returns the corresponding element from *Value_If_true*.
- If an element of *BooleanExpr* evaluates to false, returns the corresponding element from *Value_If_false*. If you omit *Value_If_false*, returns undef.
- If an element of *BooleanExpr* is neither true nor false, returns the corresponding element *Value_If_unknown*. If you omit *Value_If_unknown*, returns undef.
- If the second, third, or fourth argument of the **ifFn()** function is a single expression, the Boolean test is applied to every position in *BooleanExpr*.

Note: If the simplified *BooleanExpr* statement involves a list or matrix, all other list or matrix arguments must have the same dimension(s), and the result will have the same dimension(s).

$\text{ifFn}(\{1,2,3\} < 2.5, \{5,6,7\}, \{8,9,10\})$
 $\{5,6,10\}$

Test value of **1** is less than 2.5, so its corresponding *Value_If_True* element of **5** is copied to the result list.

Test value of **2** is less than 2.5, so its corresponding *Value_If_True* element of **6** is copied to the result list.

Test value of **3** is not less than 2.5, so its corresponding *Value_If_False* element of **10** is copied to the result list.

$\text{ifFn}(\{1,2,3\} < 2.5, 4, \{8,9,10\})$ $\{4,4,10\}$

Value_If_true is a single value and corresponds to any selected position.

$\text{ifFn}(\{1,2,3\} < 2.5, \{5,6,7\})$ $\{5,6,\text{undef}\}$

Value_If_false is not specified. Undef is used.

$\text{ifFn}(\{2, "a"\} < 2.5, \{6,7\}, \{9,10\}, "err")$
 $\{6, "err"\}$

One element selected from *Value_If_true*. One element selected from *Value_If_unknown*.

imag()

imag(*Value1*) $\Rightarrow$ *value*

Returns the imaginary part of the argument.

$\text{imag}(1+2 \cdot i)$ 2

imag(*List1*) $\Rightarrow$ *list*

Returns a list of the imaginary parts of the elements.

$\text{imag}(\{-3, 4-i, i\})$ $\{0, -1, 1\}$

imag()Catalog > **imag**(*Matrix1*) $\Rightarrow$ *matrix*

Returns a matrix of the imaginary parts of the elements.

$\text{imag}\left(\begin{bmatrix} 1 & 2 \\ i \cdot 3 & i \cdot 4 \end{bmatrix}\right)$	$\begin{bmatrix} 0 & 0 \\ 3 & 4 \end{bmatrix}$
--	--

Indirection

See #(), page 127.

inString()Catalog > **inString**(*srcString*, *subString*[, *Start*]) $\Rightarrow$ *integer*Returns the character position in string *srcString* at which the first occurrence of string *subString* begins.*Start*, if included, specifies the character position within *srcString* where the search begins. Default = 1 (the first character of *srcString*).If *srcString* does not contain *subString* or *Start* is > the length of *srcString*, returns zero.

$\text{inString}(\text{"Hello there"}, \text{"the"})$	7
$\text{inString}(\text{"ABCEFG"}, \text{"D"})$	0

int()Catalog > **int**(*Value*) $\Rightarrow$ *integer***int**(*List1*) $\Rightarrow$ *list***int**(*Matrix1*) $\Rightarrow$ *matrix*Returns the greatest integer that is less than or equal to the argument. This function is identical to **floor()**.

The argument can be a real or a complex number.

For a list or matrix, returns the greatest integer of each of the elements.

$\text{int}(-2.5)$	-3.
$\text{int}\left(\begin{bmatrix} -1.234 & 0 & 0.37 \end{bmatrix}\right)$	$\begin{bmatrix} -2. & 0 & 0. \end{bmatrix}$

intDiv()Catalog > **intDiv**(*Number1*, *Number2*) $\Rightarrow$ *integer***intDiv**(*List1*, *List2*) $\Rightarrow$ *list***intDiv**(*Matrix1*, *Matrix2*) $\Rightarrow$ *matrix*Returns the signed integer part of (*Number1* $\div$ *Number2*).For lists and matrices, returns the signed integer part of (argument 1 $\div$ argument 2) for each element pair.

$\text{intDiv}(-7, 2)$	-3
$\text{intDiv}(4, 5)$	0
$\text{intDiv}(\{12, -14, -16\}, \{5, 4, -3\})$	$\{2, -3, 5\}$

interpolate()Catalog > **interpolate**(*xValue*, *xList*, *yList*, *yPrimeList*) $\Rightarrow$ *list*

This function does the following:

Given *xList*, *yList*=**f**(*xList*), and *yPrimeList*=**f'**(*xList*) for some unknown function **f**, a cubic interpolant is used to approximate the function **f** at *xValue*. It is assumed that *xList* is a list of monotonically increasing or decreasing numbers, but this function may return a value even when it is not. This function walks through *xList* looking for an interval [*xList*[*i*], *xList*[*i*+1]] that contains *xValue*. If it finds such an interval, it returns an interpolated value for **f**(*xValue*); otherwise, it returns **undef**.

xList, *yList*, and *yPrimeList* must be of equal dimension ≥ 2 and contain expressions that simplify to numbers.

xValue can be a number or a list of numbers.

Differential equation:

$$y' = -3 \cdot y + 6 \cdot t + 5 \text{ and } y(0) = 5$$

$$rk := rk23(-3 \cdot y + 6 \cdot t + 5, t, y, \{0, 10\}, 5, 1)$$

0.	1.	2.	3.	4.
5.	3.19499	5.00394	6.99957	9.00593

To see the entire result, press $\blacktriangle$ and then use $\blacktriangleleft$ and $\blacktriangleright$ to move the cursor.

Use the **interpolate()** function to calculate the function values for the *xvalueList*:

```

xvalueList:=seq(i,i,0,10,0.5)
{0,0.5,1.,1.5,2.,2.5,3.,3.5,4.,4.5,5.,5.5,6.,6.5,7.,7.5,8.,8.5,9.,9.5,10.}

xlist:=mat►list(rk[1])
{0.,1.,2.,3.,4.,5.,6.,7.,8.,9.,10.}

ylist:=mat►list(rk[2])
{5.,3.19499,5.00394,6.99957,9.00593,10.9978}

yprimeList:=-3*y+6*t+5|y=ylist and t=xlist
{-10.,1.41503,1.98819,2.00129,1.98221,2.00679,2.00179,1.99821,1.99879,1.99181,1.98819}

interpolate(xvalueList,xlist,ylist,yprimeList)
{5.,2.67062,3.19499,4.02782,5.00394,6.00011,7.00011,8.00011,9.00011,10.0001}

```

inv χ^2 ()Catalog > **inv χ^2** (*Area*,*df*)**invChi2**(*Area*,*df*)

Computes the Inverse cumulative χ^2 (chi-square) probability function specified by degree of freedom, *df* for a given *Area* under the curve.

invF()Catalog > **invF**(*Area*,*dfNumer*,*dfDenom*)**invF**(*Area*,*dfNumer*,*dfDenom*)

computes the Inverse cumulative **F** distribution function specified by *dfNumer* and *dfDenom* for a given *Area* under the curve.

invNorm()Catalog > **invNorm**(*Area*, μ , σ)

Computes the inverse cumulative normal distribution function for a given *Area* under the normal distribution curve specified by μ and σ .

invT()Catalog > **invT**(*Area*,*df*)

Computes the inverse cumulative student-t probability function specified by degree of freedom, *df* for a given *Area* under the curve.

iPart()

Catalog >

iPart(*Number*) $\Rightarrow$ integer**iPart**(*List1*) $\Rightarrow$ list**iPart**(*Matrix1*) $\Rightarrow$ matrix

Returns the integer part of the argument.

For lists and matrices, returns the integer part of each element.

The argument can be a real or a complex number.

$\text{iPart}(-1.234)$	-1.
$\text{iPart}\left(\left\{\frac{3}{2}, -2.3, 7.003\right\}\right)$	$\{1, 2, 7\}$

irr()

Catalog >

irr(*CF0*, *CFList* [, *CFFreq*]) $\Rightarrow$ value

Financial function that calculates internal rate of return of an investment.

CF0 is the initial cash flow at time 0; it must be a real number.*CFList* is a list of cash flow amounts after the initial cash flow *CF0*.*CFFreq* is an optional list in which each element specifies the frequency of occurrence for a grouped (consecutive) cash flow amount, which is the corresponding element of *CFList*. The default is 1; if you enter values, they must be positive integers < 10,000.**Note:** See also **mirr()**, page 63.

$\text{list1} := \{6000, -8000, 2000, -3000\}$	$\{6000, -8000, 2000, -3000\}$
$\text{list2} := \{2, 2, 2, 1\}$	$\{2, 2, 2, 1\}$
$\text{irr}(5000, \text{list1}, \text{list2})$	-4.64484

isPrime()

Catalog >

isPrime(*Number*) $\Rightarrow$ Boolean constant expressionReturns true or false to indicate if *number* is a whole number ≥ 2 that is evenly divisible only by itself and 1.If *Number* exceeds about 306 digits and has no factors ≤ 1021 , **isPrime**(*Number*) displays an error message.

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing instead of at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

$\text{isPrime}(5)$	true
$\text{isPrime}(6)$	false

Function to find the next prime after a specified number:

Define $\text{nextprim}(n) = \text{Func}$	<i>Done</i>
Loop	
$n + 1 \rightarrow n$	
If $\text{isPrime}(n)$	
Return n	
EndLoop	
EndFunc	
$\text{nextprim}(7)$	11

isVoid()

Catalog >

isVoid(*Var*) $\Rightarrow$ Boolean constant expression**isVoid**(*Expr*) $\Rightarrow$ Boolean constant expression**isVoid**(*List*) $\Rightarrow$ list of Boolean constant expressions

Returns true or false to indicate if the argument is a void data type.

For more information on void elements, see page 132.

$a := _$	-
$\text{isVoid}(a)$	true
$\text{isVoid}(\{1, _, 3\})$	$\{ \text{false}, \text{true}, \text{false} \}$

L

Lbl

Catalog > 

Lbl *labelName*

Defines a label with the name *labelName* within a function.

You can use a **Goto** *labelName* instruction to transfer control to the instruction immediately following the label.

labelName must meet the same naming requirements as a variable name.

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing  instead of  at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

Define $g()$ =Func Done
 Local *temp*,*i*
 $0 \rightarrow temp$
 $1 \rightarrow i$
 Lbl *top*
 $temp+i \rightarrow temp$
 If $i < 10$ Then
 $i+1 \rightarrow i$
 Goto *top*
 EndIf
 Return *temp*
 EndFunc

$g()$ 55

lcm()

Catalog > 

lcm(*Number1*, *Number2*) $\Rightarrow$ *expression*

lcm(*List1*, *List2*) $\Rightarrow$ *list*

lcm(*Matrix1*, *Matrix2*) $\Rightarrow$ *matrix*

Returns the least common multiple of the two arguments. The **lcm** of two fractions is the **lcm** of their numerators divided by the **gcd** of their denominators. The **lcm** of fractional floating-point numbers is their product.

For two lists or matrices, returns the least common multiples of the corresponding elements.

$lcm(6,9)$ 18
 $lcm\left(\left\{\frac{1}{3}, -14, 16\right\}, \left\{\frac{2}{15}, 7, 5\right\}\right)$ $\left\{\frac{2}{3}, 14, 80\right\}$

left()

Catalog > 

left(*sourceString*[, *Num*]) $\Rightarrow$ *string*

Returns the leftmost *Num* characters contained in character string *sourceString*.

If you omit *Num*, returns all of *sourceString*.

left(*List1*[, *Num*]) $\Rightarrow$ *list*

Returns the leftmost *Num* elements contained in *List1*.

If you omit *Num*, returns all of *List1*.

left(*Comparison*) $\Rightarrow$ *expression*

Returns the left-hand side of an equation or inequality.

$left("Hello", 2)$ "He"
 $left(\{1, 3, -2, 4\}, 3)$ $\{1, 3, -2\}$

libShortcut()Catalog > 

libShortcut(*LibNameString*, *ShortcutNameString*
[, *LibPrivFlag*]) $\Rightarrow$ list of variables

Creates a variable group in the current problem that contains references to all the objects in the specified library document *libNameString*. Also adds the group members to the Variables menu. You can then refer to each object using its *ShortcutNameString*.

Set *LibPrivFlag*=0 to exclude private library objects (default)
Set *LibPrivFlag*=1 to include private library objects

To copy a variable group, see **CopyVar** on page 18.
To delete a variable group, see **DelVar** on page 29.

This example assumes a properly stored and refreshed library document named **linalg2** that contains objects defined as *clearmat*, *gauss1*, and *gauss2*.

```
getVarInfo("linalg2")
{
  clearmat  "FUNC"  "LibPub "
  gauss1    "PRGM"  "LibPriv "
  gauss2    "FUNC"  "LibPub "
}

libShortcut("linalg2", "la")
{ la.clearmat, la.gauss2 }

libShortcut("linalg2", "la", 1)
{ la.clearmat, la.gauss1, la.gauss2 }
```

LinRegBxCatalog > 

LinRegBx *X*, *Y* [, *Freq*] [, *Category*, *Include*]

Computes the linear regression $y = a + b \cdot x$ on lists *X* and *Y* with frequency *Freq*. A summary of results is stored in the *stat.results* variable. (See page 98.)

All the lists must have equal dimension except for *Include*.

X and *Y* are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding *X* and *Y* data point. The default value is 1. All elements must be integers ≥ 0 .

Category is a list of numeric or string category codes for the corresponding *X* and *Y* data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.RegEqn	Regression Equation: $a + b \cdot x$
stat.a, stat.b	Regression coefficients
stat.r ²	Coefficient of determination
stat.r	Correlation coefficient
stat.Resid	Residuals from the regression
stat.XReg	List of data points in the modified <i>X List</i> actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.YReg	List of data points in the modified <i>Y List</i> actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.FreqReg	List of frequencies corresponding to <i>stat.XReg</i> and <i>stat.YReg</i>

LinRegMx $X, Y[, [Freq], [Category, Include]]$

Computes the linear regression $y = m \cdot x + b$ on lists X and Y with frequency $Freq$. A summary of results is stored in the *stat.results* variable. (See page 98.)

All the lists must have equal dimension except for *Include*.

X and Y are lists of independent and dependent variables.

$Freq$ is an optional list of frequency values. Each element in $Freq$ specifies the frequency of occurrence for each corresponding X and Y data point. The default value is 1. All elements must be integers ≥ 0 .

Category is a list of numeric or string category codes for the corresponding X and Y data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.RegEqn	Regression Equation: $y = m \cdot x + b$
stat.m, stat.b	Regression coefficients
stat.r ²	Coefficient of determination
stat.r	Correlation coefficient
stat.Resid	Residuals from the regression
stat.XReg	List of data points in the modified X List actually used in the regression based on restrictions of $Freq$, $Category$ List, and $Include$ Categories
stat.YReg	List of data points in the modified Y List actually used in the regression based on restrictions of $Freq$, $Category$ List, and $Include$ Categories
stat.FreqReg	List of frequencies corresponding to $stat.XReg$ and $stat.YReg$

LinRegtIntervals**LinRegtIntervals** $X, Y[, F[, 0[, CLev]]]$

For Slope. Computes a level C confidence interval for the slope.

LinRegtIntervals $X, Y[, F[, 1, Xval[, CLev]]]$

For Response. Computes a predicted y -value, a level C prediction interval for a single observation, and a level C confidence interval for the mean response.

A summary of results is stored in the *stat.results* variable. (See page 98.)

All the lists must have equal dimension.

X and Y are lists of independent and dependent variables.

F is an optional list of frequency values. Each element in F specifies the frequency of occurrence for each corresponding X and Y data point. The default value is 1. All elements must be integers ≥ 0 .

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.RegEqn	Regression Equation: $a + b \cdot x$
stat.a, stat.b	Regression coefficients
stat.df	Degrees of freedom
stat. r^2	Coefficient of determination
stat.r	Correlation coefficient
stat.Resid	Residuals from the regression

For Slope type only

Output variable	Description
[stat.CLower, stat.CUpper]	Confidence interval for the slope
stat.ME	Confidence interval margin of error
stat.SESlope	Standard error of slope
stat.s	Standard error about the line

For Response type only

Output variable	Description
[stat.CLower, stat.CUpper]	Confidence interval for the mean response
stat.ME	Confidence interval margin of error
stat.SE	Standard error of mean response
[stat.LowerPred, stat.UpperPred]	Prediction interval for a single observation
stat.MEPred	Prediction interval margin of error
stat.SEPred	Standard error for prediction
stat. $\hat{y}$	$a + b \cdot X_{\text{Val}}$

LinRegTTest $X, Y[, Freq[, Hypoth]]$

Computes a linear regression on the X and Y lists and a t test on the value of slope β and the correlation coefficient ρ for the equation $y = \alpha + \beta x$. It tests the null hypothesis $H_0: \beta = 0$ (equivalently, $\rho = 0$) against one of three alternative hypotheses.

All the lists must have equal dimension.

X and Y are lists of independent and dependent variables.

$Freq$ is an optional list of frequency values. Each element in $Freq$ specifies the frequency of occurrence for each corresponding X and Y data point. The default value is 1. All elements must be integers ≥ 0 .

$Hypoth$ is an optional value specifying one of three alternative hypotheses against which the null hypothesis ($H_0: \beta = \rho = 0$) will be tested.

For $H_a: \beta \neq 0$ and $\rho \neq 0$ (default), set $Hypoth = 0$

For $H_a: \beta < 0$ and $\rho < 0$, set $Hypoth < 0$

For $H_a: \beta > 0$ and $\rho > 0$, set $Hypoth > 0$

A summary of results is stored in the *stat.results* variable. (See page 98.)

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.RegEqn	Regression equation: $a + b \cdot x$
stat.t	t -Statistic for significance test
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.df	Degrees of freedom
stat.a, stat.b	Regression coefficients
stat.s	Standard error about the line
stat.SESlope	Standard error of slope
stat. r^2	Coefficient of determination
stat.r	Correlation coefficient
stat.Resid	Residuals from the regression

linSolve()Catalog > **linSolve**(SystemOfLinearEqns, Var1, Var2, ...) $\Rightarrow$ list**linSolve**(LinearEqn1 and LinearEqn2 and ...,Var1, Var2, ...) $\Rightarrow$ list**linSolve**(LinearEqn1, LinearEqn2, ..., {Var1, Var2, ...}) $\Rightarrow$ list**linSolve**(SystemOfLinearEqns, {Var1, Var2, ...}) $\Rightarrow$ list**linSolve**(LinearEqn1 and LinearEqn2 and ...,{Var1, Var2, ...}) $\Rightarrow$ list**linSolve**(LinearEqn1, LinearEqn2, ..., {Var1, Var2, ...}) $\Rightarrow$ list

Returns a list of solutions for the variables Var1, Var2, ...

The first argument must evaluate to a system of linear equations or a single linear equation. Otherwise, an argument error occurs.

For example, evaluating **linSolve**(x=1 and x=2,x) produces an "Argument Error" result.

$$\text{linSolve}\left(\left\{\begin{array}{l} 2 \cdot x + 4 \cdot y = 3 \\ 5 \cdot x - 3 \cdot y = 7 \end{array}\right\}, \{x, y\}\right) \quad \left\{\begin{array}{l} 37 \\ 26 \end{array}, \begin{array}{l} 1 \\ 26 \end{array}\right\}$$

$$\text{linSolve}\left(\left\{\begin{array}{l} 2 \cdot x = 3 \\ 5 \cdot x - 3 \cdot y = 7 \end{array}\right\}, \{x, y\}\right) \quad \left\{\begin{array}{l} 3 \\ 2 \end{array}, \begin{array}{l} 1 \\ 6 \end{array}\right\}$$

$$\text{linSolve}\left(\left\{\begin{array}{l} \text{apple} + 4 \cdot \text{pear} = 23 \\ 5 \cdot \text{apple} - \text{pear} = 17 \end{array}\right\}, \{\text{apple}, \text{pear}\}\right) \quad \left\{\begin{array}{l} 13 \\ 3 \end{array}, \begin{array}{l} 14 \\ 3 \end{array}\right\}$$

$$\text{linSolve}\left(\left\{\begin{array}{l} \text{apple} \cdot 4 + \frac{\text{pear}}{3} = 14 \\ -\text{apple} + \text{pear} = 6 \end{array}\right\}, \{\text{apple}, \text{pear}\}\right) \quad \left\{\begin{array}{l} 36 \\ 13 \end{array}, \begin{array}{l} 114 \\ 13 \end{array}\right\}$$

ΔList()Catalog > **ΔList**(List1) $\Rightarrow$ list**Note:** You can insert this function from the keyboard by typing **deltaList**(...).

Returns a list containing the differences between consecutive elements in List1. Each element of List1 is subtracted from the next element of List1. The resulting list is always one element shorter than the original List1.

$$\Delta\text{List}(\{20, 30, 45, 70\}) \quad \{10, 15, 25\}$$

list►mat()Catalog > **list►mat**(List [, elementsPerRow]) $\Rightarrow$ matrix

Returns a matrix filled row-by-row with the elements from List.

elementsPerRow, if included, specifies the number of elements per row. Default is the number of elements in List (one row).

If List does not fill the resulting matrix, zeros are added.

Note: You can insert this function from the computer keyboard by typing **list@>mat**(...).

$$\text{list}\blacktriangleright\text{mat}(\{1, 2, 3\}) \quad \begin{bmatrix} 1 & 2 & 3 \end{bmatrix}$$

$$\text{list}\blacktriangleright\text{mat}(\{1, 2, 3, 4, 5\}, 2) \quad \begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 0 \end{bmatrix}$$

ln()  **keys****ln**(Value1) $\Rightarrow$ value**ln**(List1) $\Rightarrow$ list

Returns the natural logarithm of the argument.

For a list, returns the natural logarithms of the elements.

$$\ln(2.) \quad 0.693147$$

If complex format mode is Real:

$$\ln(\{-3, 1.2, 5\})$$

"Error: Non-real calculation"

If complex format mode is Rectangular:

$$\ln(\{-3, 1.2, 5\})$$

$$\{1.09861 + 3.14159 \cdot i, 0.182322, 1.60944\}$$

ln()ctrl **e^x** keys**ln(squareMatrix1)** $\Rightarrow$ *squareMatrix*

Returns the matrix natural logarithm of *squareMatrix1*. This is not the same as calculating the natural logarithm of each element. For information about the calculation method, refer to **cos()** on.

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

In Radian angle mode and Rectangular complex format:

$$\ln \begin{pmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{pmatrix} = \begin{pmatrix} 1.83145+1.73485 \cdot i & 0.009193-1.49086 \\ 0.448761-0.725533 \cdot i & 1.06491+0.623491 \cdot i \\ -0.266891-2.08316 \cdot i & 1.12436+1.79018 \cdot i \end{pmatrix}$$

To see the entire result, press $\blacktriangle$ and then use $\blacktriangleleft$ and $\blacktriangleright$ to move the cursor.

LnRegCatalog > **LnReg** *X*, *Y* [, *Freq*] [, *Category*, *Include*]

Computes the logarithmic regression $y = a + b \cdot \ln(x)$ on lists *X* and *Y* with frequency *Freq*. A summary of results is stored in the *stat.results* variable. (See page 98.)

All the lists must have equal dimension except for *Include*.

X and *Y* are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding *X* and *Y* data point. The default value is 1. All elements must be integers ≥ 0 .

Category is a list of numeric or string category codes for the corresponding *X* and *Y* data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.RegEqn	Regression equation: $a + b \cdot \ln(x)$
stat.a, stat.b	Regression coefficients
stat.r ²	Coefficient of linear determination for transformed data
stat.r	Correlation coefficient for transformed data ($\ln(x)$, y)
stat.Resid	Residuals associated with the logarithmic model
stat.ResidTrans	Residuals associated with linear fit of transformed data
stat.XReg	List of data points in the modified <i>X List</i> actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.YReg	List of data points in the modified <i>Y List</i> actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.FreqReg	List of frequencies corresponding to <i>stat.XReg</i> and <i>stat.YReg</i>

Local

Catalog > 

Local *Var1* [, *Var2*] [, *Var3*] ...

Declares the specified *vars* as local variables. Those variables exist only during evaluation of a function and are deleted when the function finishes execution.

Note: Local variables save memory because they only exist temporarily. Also, they do not disturb any existing global variable values. Local variables must be used for **For** loops and for temporarily saving values in a multi-line function since modifications on global variables are not allowed in a function.

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing 

instead of  at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

```
Define rollcount()=Func
  Local i
  1 → i
  Loop
  If randInt(1,6)=randInt(1,6)
  Goto end
  i+1 → i
EndLoop
Lbl end
Return i
EndFunc
```

Done

rollcount()	16
rollcount()	3

Lock

Catalog > 

Lock *Var1* [, *Var2*] [, *Var3*] ...

Lock *Var*.

Locks the specified variables or variable group. Locked variables cannot be modified or deleted.

You cannot lock or unlock the system variable *Ans*, and you cannot lock the system variable groups *stat*, or *tvm*.

Note: The **Lock** command clears the Undo/Redo history when applied to unlocked variables.

See **unLock**, page 110, and **getLockInfo()**, page 42.

a:=65	65
Lock a	<i>Done</i>
getLockInfo(a)	1
a:=75	"Error: Variable is locked."
DelVar a	"Error: Variable is locked."
Unlock a	<i>Done</i>
a:=75	75
DelVar a	<i>Done</i>

log()

ctrl 10x keys

log(Value1[,Value2]) $\Rightarrow$ value

log(List1[,Value2]) $\Rightarrow$ list

Returns the base-Value2 logarithm of the first argument.

Note: See also **Log template**, page 2.

For a list, returns the base-Value2 logarithm of the elements.

If the second argument is omitted, 10 is used as the base.

$$\log_{10} (2.) = 0.30103$$

$$\log_4 (2.) = 0.5$$

$$\log_3 (10) - \log_3 (5) = 0.63093$$

If complex format mode is Real:

$$\log_{10} (\{-3, 1.2, 5\})$$

"Error: Non-real calculation"

If complex format mode is Rectangular:

$$\log_{10} (\{-3, 1.2, 5\})$$
$$\{0.477121 + 1.36438 \cdot i, 0.079181, 0.69897\}$$

In Radian angle mode and Rectangular complex format:

$$\log_{10} \begin{pmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{pmatrix}$$
$$\begin{bmatrix} 0.795387 + 0.753438 \cdot i & 0.003993 - 0.6474 \cdot i \\ 0.194895 - 0.315095 \cdot i & 0.462485 + 0.2707 \cdot i \\ -0.115909 - 0.904706 \cdot i & 0.488304 + 0.7774 \cdot i \end{bmatrix}$$

To see the entire result, press $\blacktriangle$ and then use $\blacktriangleleft$ and $\blacktriangleright$ to move the cursor.

Logistic

Catalog > 

Logistic X, Y[, [Freq] [, Category, Include]]

Computes the logistic regression $y = (d/(1+a \cdot e^{-bx}))$ on lists X and Y with frequency Freq. A summary of results is stored in the stat.results variable. (See page 98.)

All the lists must have equal dimension except for Include.

X and Y are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in Freq specifies the frequency of occurrence for each corresponding X and Y data point. The default value is 1. All elements must be integers ≥ 0 .

Category is a list of numeric or string category codes for the corresponding X and Y data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.RegEqn	Regression equation: $c/(1+a \cdot e^{-bx})$
stat.a, stat.b, stat.c	Regression coefficients
stat.Resid	Residuals from the regression
stat.XReg	List of data points in the modified <i>X List</i> actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.YReg	List of data points in the modified <i>Y List</i> actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.FreqReg	List of frequencies corresponding to <i>stat.XReg</i> and <i>stat.YReg</i>

LogisticD

Catalog > 

LogisticD *X*, *Y* [, [*Iterations*], [*Freq*] [, *Category*, *Include*]]

Computes the logistic regression $y = (c/(1+a \cdot e^{-bx})+d)$ on lists *X* and *Y* with frequency *Freq*, using a specified number of *Iterations*. A summary of results is stored in the *stat.results* variable. (See page 98.)

All the lists must have equal dimension except for *Include*.

X and *Y* are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding *X* and *Y* data point. The default value is 1. All elements must be integers ≥ 0 .

Category is a list of numeric or string category codes for the corresponding *X* and *Y* data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.RegEqn	Regression equation: $c/(1+a \cdot e^{-bx})+d$
stat.a, stat.b, stat.c, stat.d	Regression coefficients
stat.Resid	Residuals from the regression
stat.XReg	List of data points in the modified <i>X List</i> actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.YReg	List of data points in the modified <i>Y List</i> actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.FreqReg	List of frequencies corresponding to <i>stat.XReg</i> and <i>stat.YReg</i>

Loop

Catalog >

Loop

Block

EndLoop

Repeatedly executes the statements in *Block*. Note that the loop will be executed endlessly, unless a **Goto** or **Exit** instruction is executed within *Block*.

Block is a sequence of statements separated with the ":" character.

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing instead of at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

Define $\text{rollcount}()$ =Func

Return *i*

EndFunc

Done

$\text{rollcount}()$	16
$\text{rollcount}()$	3

LU

Catalog >

LU *Matrix*, *lMatrix*, *uMatrix*, *pMatrix*[, *Tol*]

Calculates the Doolittle LU (lower-upper) decomposition of a real or complex matrix. The lower triangular matrix is stored in *lMatrix*, the upper triangular matrix in *uMatrix*, and the permutation matrix (which describes the row swaps done during the calculation) in *pMatrix*.

$\text{lMatrix} \cdot \text{uMatrix} = \text{pMatrix} \cdot \text{matrix}$

Optionally, any matrix element is treated as zero if its absolute value is less than *Tol*. This tolerance is used only if the matrix has floating-point entries and does not contain any symbolic variables that have not been assigned a value. Otherwise, *Tol* is ignored.

- If you use or set the **Auto or Approximate** mode to Approximate, computations are done using floating-point arithmetic.
- If *Tol* is omitted or not used, the default tolerance is calculated as:
 $5E-14 \cdot \max(\dim(\text{Matrix})) \cdot \text{rowNorm}(\text{Matrix})$

The **LU** factorization algorithm uses partial pivoting with row interchanges.

$\begin{bmatrix} 6 & 12 & 18 \\ 5 & 14 & 31 \\ 3 & 8 & 18 \end{bmatrix} \rightarrow m1$	$\begin{bmatrix} 6 & 12 & 18 \\ 5 & 14 & 31 \\ 3 & 8 & 18 \end{bmatrix}$

M

mat►list()

Catalog >

mat►list(*Matrix*) $\Rightarrow$ list

Returns a list filled with the elements in *Matrix*. The elements are copied from *Matrix* row by row.

Note: You can insert this function from the computer keyboard by typing **mat>list(...)**.

$\text{mat} \blacktriangleright \text{list}(\begin{bmatrix} 1 & 2 & 3 \end{bmatrix})$

$\{1, 2, 3\}$

$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix} \rightarrow m1$	$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$
---	--

$\text{mat} \blacktriangleright \text{list}(m1)$

$\{1, 2, 3, 4, 5, 6\}$

max()Catalog > **max**(Value1, Value2) $\Rightarrow$ expression**max**(List1, List2) $\Rightarrow$ list**max**(Matrix1, Matrix2) $\Rightarrow$ matrix

Returns the maximum of the two arguments. If the arguments are two lists or matrices, returns a list or matrix containing the maximum value of each pair of corresponding elements.

max(List) $\Rightarrow$ expression

Returns the maximum element in list.

max(Matrix1) $\Rightarrow$ matrix

Returns a row vector containing the maximum element of each column in Matrix1.

Empty (void) elements are ignored. For more information on empty elements, see page 132.

Note: See also **min()**.

$$\begin{array}{rcl} \text{max}(2.3, 1.4) & & 2.3 \\ \text{max}(\{1, 2\}, \{-4, 3\}) & & \{1, 3\} \end{array}$$

$$\text{max}(\{0, 1, -7, 1.3, 0.5\}) \quad 1.3$$

$$\text{max}\left(\begin{bmatrix} 1 & -3 & 7 \\ -4 & 0 & 0.3 \end{bmatrix}\right) \quad \begin{bmatrix} 1 & 0 & 7 \end{bmatrix}$$

mean()Catalog > **mean**(List[, freqList]) $\Rightarrow$ expression

Returns the mean of the elements in List.

Each freqList element counts the number of consecutive occurrences of the corresponding element in List.

mean(Matrix1[, freqMatrix]) $\Rightarrow$ matrix

Returns a row vector of the means of all the columns in Matrix1.

Each freqMatrix element counts the number of consecutive occurrences of the corresponding element in Matrix1.

Empty (void) elements are ignored. For more information on empty elements, see page 132.

$$\begin{array}{rcl} \text{mean}(\{0.2, 0, 1, -0.3, 0.4\}) & & 0.26 \\ \text{mean}(\{1, 2, 3\}, \{3, 2, 1\}) & & \frac{5}{3} \end{array}$$

In Rectangular vector format:

$$\text{mean}\left(\begin{bmatrix} 0.2 & 0 \\ -1 & 3 \\ 0.4 & -0.5 \end{bmatrix}\right) \quad \begin{bmatrix} -0.133333 & 0.833333 \end{bmatrix}$$

$$\text{mean}\left(\begin{bmatrix} \frac{1}{5} & 0 \\ -1 & 3 \\ \frac{2}{5} & \frac{-1}{2} \end{bmatrix}\right) \quad \begin{bmatrix} \frac{-2}{15} & \frac{5}{6} \end{bmatrix}$$

$$\text{mean}\left(\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix}, \begin{bmatrix} 5 & 3 \\ 4 & 1 \\ 6 & 2 \end{bmatrix}\right) \quad \begin{bmatrix} \frac{47}{15} & \frac{11}{3} \end{bmatrix}$$

median()Catalog > **median**(List[, freqList]) $\Rightarrow$ expression

Returns the median of the elements in List.

Each freqList element counts the number of consecutive occurrences of the corresponding element in List.

$$\text{median}(\{0.2, 0, 1, -0.3, 0.4\}) \quad 0.2$$

median()Catalog > **median**(*Matrix1* [, *freqMatrix*]) $\Rightarrow$ *matrix*Returns a row vector containing the medians of the columns in *Matrix1*.Each *freqMatrix* element counts the number of consecutive occurrences of the corresponding element in *Matrix1*.**Notes:**

- All entries in the list or matrix must simplify to numbers.
- Empty (void) elements in the list or matrix are ignored. For more information on empty elements, see page 132.

median	$\begin{bmatrix} 0.2 & 0 \\ 1 & -0.3 \\ 0.4 & -0.5 \end{bmatrix}$	$\begin{bmatrix} 0.4 & -0.3 \end{bmatrix}$
---------------	---	--

MedMedCatalog > **MedMed** *X*, *Y* [, *Freq*] [, *Category*, *Include*]Computes the median-median line $y = (m \cdot x + b)$ on lists *X* and *Y* with frequency *Freq*. A summary of results is stored in the *stat.results* variable. (See page 98.)All the lists must have equal dimension except for *Include*.*X* and *Y* are lists of independent and dependent variables.*Freq* is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding *X* and *Y* data point. The default value is 1. All elements must be integers ≥ 0 .*Category* is a list of numeric or string category codes for the corresponding *X* and *Y* data.*Include* is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.RegEqn	Median-median line equation: $m \cdot x + b$
stat.m, stat.b	Model coefficients
stat.Resid	Residuals from the median-median line
stat.XReg	List of data points in the modified <i>X List</i> actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.YReg	List of data points in the modified <i>Y List</i> actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.FreqReg	List of frequencies corresponding to <i>stat.XReg</i> and <i>stat.YReg</i>

mid()Catalog > **mid**(*sourceString*, *Start* [, *Count*]) $\Rightarrow$ *string*Returns *Count* characters from character string *sourceString*, beginning with character number *Start*.If *Count* is omitted or is greater than the dimension of *sourceString*, returns all characters from *sourceString*, beginning with character number *Start*.*Count* must be ≥ 0 . If *Count* = 0, returns an empty string.

mid ("Hello there",2)	"ello there"
mid ("Hello there",7,3)	"the"
mid ("Hello there",1,5)	"Hello"
mid ("Hello there",1,0)	" "

mid()Catalog > **mid**(sourceList, Start [, Count]) $\Rightarrow$ list

Returns Count elements from sourceList, beginning with element number Start.

If Count is omitted or is greater than the dimension of sourceList, returns all elements from sourceList, beginning with element number Start.

Count must be ≥ 0 . If Count = 0, returns an empty list.**mid**(sourceStringList, Start [, Count]) $\Rightarrow$ list

Returns Count strings from the list of strings sourceStringList, beginning with element number Start.

 $\text{mid}(\{9,8,7,6\},3)$ $\{7,6\}$ $\text{mid}(\{9,8,7,6\},2,2)$ $\{8,7\}$ $\text{mid}(\{9,8,7,6\},1,2)$ $\{9,8\}$ $\text{mid}(\{9,8,7,6\},1,0)$ $\{\}$ $\text{mid}(\{"A","B","C","D"\},2,2)$ $\{"B","C"\}$ **min()**Catalog > **min**(Value1, Value2) $\Rightarrow$ expression**min**(List1, List2) $\Rightarrow$ list**min**(Matrix1, Matrix2) $\Rightarrow$ matrix

Returns the minimum of the two arguments. If the arguments are two lists or matrices, returns a list or matrix containing the minimum value of each pair of corresponding elements.

min(List) $\Rightarrow$ expression

Returns the minimum element of List.

min(Matrix1) $\Rightarrow$ matrix

Returns a row vector containing the minimum element of each column in Matrix1.

Note: See also **max()**. $\text{min}(2.3,1.4)$ 1.4 $\text{min}(\{1,2\},\{-4,3\})$ $\{-4,2\}$ $\text{min}(\{0,1,-7,1.3,0.5\})$ -7 $\text{min}\left(\begin{bmatrix} 1 & -3 & 7 \\ -4 & 0 & 0.3 \end{bmatrix}\right)$ $\begin{bmatrix} -4 & -3 & 0.3 \end{bmatrix}$ **mirr()**Catalog > **mirr**(financeRate, reinvestRate, CF0, CFList[, CFFreq])

Financial function that returns the modified internal rate of return of an investment.

financeRate is the interest rate that you pay on the cash flow amounts.

reinvestRate is the interest rate at which the cash flows are reinvested.

CF0 is the initial cash flow at time 0; it must be a real number.

CFList is a list of cash flow amounts after the initial cash flow CF0.

CFFreq is an optional list in which each element specifies the frequency of occurrence for a grouped (consecutive) cash flow amount, which is the corresponding element of CFList. The default is 1; if you enter values, they must be positive integers < 10,000.

Note: See also **irr()**, page 49. $list1 := \{6000, -8000, 2000, -3000\}$
 $\{6000, -8000, 2000, -3000\}$ $list2 := \{2, 2, 2, 1\}$ $\{2, 2, 2, 1\}$ $\text{mirr}(4.65, 12, 5000, list1, list2)$ 13.41608607

mod()Catalog > **mod**(Value1, Value2) $\Rightarrow$ expression**mod**(List1, List2) $\Rightarrow$ list**mod**(Matrix1, Matrix2) $\Rightarrow$ matrix

Returns the first argument modulo the second argument as defined by the identities:

$$\text{mod}(x, 0) = x$$

$$\text{mod}(x, y) = x - y \text{ floor}(x/y)$$

When the second argument is non-zero, the result is periodic in that argument. The result is either zero or has the same sign as the second argument.

If the arguments are two lists or two matrices, returns a list or matrix containing the modulo of each pair of corresponding elements.

Note: See also **remain()**, page 84

$\text{mod}(7, 0)$	7
$\text{mod}(7, 3)$	1
$\text{mod}(-7, 3)$	2
$\text{mod}(7, -3)$	-2
$\text{mod}(-7, -3)$	-1
$\text{mod}(\{12, -14, 16\}, \{9, 7, -5\})$	$\{3, 0, -4\}$

mRow()Catalog > **mRow**(Value, Matrix1, Index) $\Rightarrow$ matrix

Returns a copy of Matrix1 with each element in row Index of Matrix1 multiplied by Value.

$$\text{mRow}\left(\frac{-1}{3}, \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}, 2\right) = \begin{bmatrix} 1 & 2 \\ -1 & -4 \\ 3 & \end{bmatrix}$$

mRowAdd()Catalog > **mRowAdd**(Value, Matrix1, Index1, Index2) $\Rightarrow$ matrix

Returns a copy of Matrix1 with each element in row Index2 of Matrix1 replaced with:

$$\text{Value} \cdot \text{row Index1} + \text{row Index2}$$

$$\text{mRowAdd}\left(-3, \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}, 1, 2\right) = \begin{bmatrix} 1 & 2 \\ 0 & -2 \end{bmatrix}$$

MultRegCatalog > **MultReg** Y, X1[,X2[,X3,...[,X10]]]Calculates multiple linear regression of list Y on lists X1, X2, ..., X10. A summary of results is stored in the *stat.results* variable. (See page 98.)

All the lists must have equal dimension.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.RegEqn	Regression Equation: $b_0 + b_1 \cdot x_1 + b_2 \cdot x_2 + \dots$
stat.b0, stat.b1, ...	Regression coefficients
stat.R ²	Coefficient of multiple determination
stat. $\hat{y}$ List	$\hat{y}$ List = $b_0 + b_1 \cdot x_1 + \dots$
stat.Resid	Residuals from the regression

MultRegIntervals $Y, X1[,X2[,X3,...[,X10]]], XValList[, CLevel]$

Computes a predicted y-value, a level C prediction interval for a single observation, and a level C confidence interval for the mean response.

A summary of results is stored in the *stat.results* variable. (See page 98.)

All the lists must have equal dimension.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.RegEqn	Regression Equation: $b_0 + b_1 \cdot x_1 + b_2 \cdot x_2 + \dots$
stat. $\hat{y}$	A point estimate: $\hat{y} = b_0 + b_1 \cdot x_1 + \dots$ for <i>XValList</i>
stat.dfError	Error degrees of freedom
stat.CLower, stat.CUpper	Confidence interval for a mean response
stat.ME	Confidence interval margin of error
stat.SE	Standard error of mean response
stat.LowerPred, stat.UpperrPred	Prediction interval for a single observation
stat.MEPred	Prediction interval margin of error
stat.SEPred	Standard error for prediction
stat.bList	List of regression coefficients, $\{b_0, b_1, b_2, \dots\}$
stat.Resid	Residuals from the regression

MultRegTests

MultRegTests $Y, X1[,X2[,X3,...[,X10]]]$

Multiple linear regression test computes a multiple linear regression on the given data and provides the global F test statistic and t test statistics for the coefficients.

A summary of results is stored in the *stat.results* variable. (See page 98.)

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Outputs

Output variable	Description
stat.RegEqn	Regression Equation: $b_0 + b_1 \cdot x_1 + b_2 \cdot x_2 + \dots$
stat.F	Global F test statistic
stat.PVal	P-value associated with global F statistic
stat.R ²	Coefficient of multiple determination

Output variable	Description
stat.AdjR ²	Adjusted coefficient of multiple determination
stat.s	Standard deviation of the error
stat.DW	Durbin-Watson statistic; used to determine whether first-order auto correlation is present in the model
stat.dfReg	Regression degrees of freedom
stat.SSReg	Regression sum of squares
stat.MSReg	Regression mean square
stat.dfError	Error degrees of freedom
stat.SSError	Error sum of squares
stat.MSError	Error mean square
stat.bList	{b ₀ , b ₁ , ...} List of coefficients
stat.tList	List of t statistics, one for each coefficient in the bList
stat.PList	List P-values for each t statistic
stat.SEList	List of standard errors for coefficients in bList
stat. $\hat{y}$ List	$\hat{y}$ List = $b_0 + b_1 \cdot x_1 + \dots$
stat.Resid	Residuals from the regression
stat.sResid	Standardized residuals; obtained by dividing a residual by its standard deviation
stat.CookDist	Cook's distance; measure of the influence of an observation based on the residual and leverage
stat.Leverage	Measure of how far the values of the independent variable are from their mean values

N

nand

ctrl [=] keys

BooleanExpr1 **nand** *BooleanExpr2* returns *Boolean expression*
BooleanList1 **nand** *BooleanList2* returns *Boolean list*
BooleanMatrix1 **nand** *BooleanMatrix2* returns *Boolean matrix*

$x \geq 3$ and $x \geq 4$ $x \geq 4$

$x \geq 3$ nand $x \geq 4$ $x < 4$

Returns the negation of a logical **and** operation on the two arguments. Returns true, false, or a simplified form of the equation.

For lists and matrices, returns comparisons element by element.

Integer1 **nand** *Integer2* $\Rightarrow$ *integer*

3 and 4 0

3 nand 4 -1

$\{1, 2, 3\}$ and $\{3, 2, 1\}$ $\{1, 2, 1\}$

$\{1, 2, 3\}$ nand $\{3, 2, 1\}$ $\{-2, -3, -2\}$

Compares two real integers bit-by-bit using a **nand** operation. Internally, both integers are converted to signed, 64-bit binary numbers. When corresponding bits are compared, the result is 1 if both bits are 1; otherwise, the result is 0. The returned value represents the bit results, and is displayed according to the Base mode.

You can enter the integers in any number base. For a binary or hexadecimal entry, you must use the 0b or 0h prefix, respectively. Without a prefix, integers are treated as decimal (base 10).

nCr()Catalog > **nCr**(*Value1*, *Value2*) $\Rightarrow$ *expression*

For integer *Value1* and *Value2* with $Value1 \geq Value2 \geq 0$, **nCr()** is the number of combinations of *Value1* things taken *Value2* at a time. (This is also known as a binomial coefficient.)

$$nCr(z, 3) | z=5 \quad 10$$

$$nCr(z, 3) | z=6 \quad 20$$

nCr(*Value*, 0) $\Rightarrow$ 1**nCr**(*Value*, *negInteger*) $\Rightarrow$ 0**nCr**(*Value*, *posInteger*) $\Rightarrow Value \cdot (Value-1) \dots$ $(Value-posInteger+1) / posInteger!$ **nCr**(*Value*, *nonInteger*) $\Rightarrow$ *expression!* $((Value-nonInteger)! \cdot nonInteger!)$ **nCr**(*List1*, *List2*) $\Rightarrow$ *list*

Returns a list of combinations based on the corresponding element pairs in the two lists. The arguments must be the same size list.

$$nCr(\{5, 4, 3\}, \{2, 4, 2\}) \quad \{10, 1, 3\}$$

nCr(*Matrix1*, *Matrix2*) $\Rightarrow$ *matrix*

Returns a matrix of combinations based on the corresponding element pairs in the two matrices. The arguments must be the same size matrix.

$$nCr\left(\begin{bmatrix} 6 & 5 \\ 4 & 3 \end{bmatrix}, \begin{bmatrix} 2 & 2 \\ 2 & 2 \end{bmatrix}\right) \quad \begin{bmatrix} 15 & 10 \\ 6 & 3 \end{bmatrix}$$

nDerivative()Catalog > **nDerivative**(*Expr1*, *Var*=*Value*, *Order*) $\Rightarrow$ *value***nDerivative**(*Expr1*, *Var*, *Order*) | *Var*=*Value* $\Rightarrow$ *value*

Returns the numerical derivative calculated using auto differentiation methods.

$$nDerivative(|x|, x=1) \quad 1$$

$$nDerivative(|x|, x)|x=0 \quad \text{undef}$$

When *Value* is specified, it overrides any prior variable assignment or any current "|" substitution for the variable.

$$nDerivative(\sqrt{x-1}, x)|x=1 \quad \text{undef}$$

If the variable *Var* does not contain a numeric value, you must provide *Value*.

Order of the derivative must be 1 or 2.

Note: The **nDerivative()** algorithm has a limitation: it works recursively through the unsimplified expression, computing the numeric value of the first derivative (and second, if applicable) and the evaluation of each subexpression, which may lead to an unexpected result.

$$nDerivative\left|x \cdot \left(x^2 + x\right)^{\frac{1}{3}}, x, 1\right| x=0 \quad \text{undef}$$

Consider the example on the right. The first derivative of $x \cdot (x^2 + x)^{1/3}$ at $x=0$ is equal to 0. However, because the first derivative of the subexpression $(x^2 + x)^{1/3}$ is undefined at $x=0$, and this value is used to calculate the derivative of the total expression, **nDerivative()** reports the result as undefined and displays a warning message.

$$\text{centralDiff}\left|x \cdot \left(x^2 + x\right)^{\frac{1}{3}}, x\right| x=0 \quad 0.000033$$

If you encounter this limitation, verify the solution graphically. You can also try using **centralDiff()**.

newList()Catalog > **newList**(*numElements*) $\Rightarrow$ *list*

Returns a list with a dimension of *numElements*. Each element is zero.

$$\text{newList}(4) \quad \{0, 0, 0, 0\}$$

newMat()Catalog > **newMat**(numRows, numColumns) $\Rightarrow$ matrix

Returns a matrix of zeros with the dimension numRows by numColumns.

newMat (2,3)	$\begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$
---------------------	--

nfMax()Catalog > **nfMax**(Expr, Var) $\Rightarrow$ value**nfMax**(Expr, Var, lowBound) $\Rightarrow$ value**nfMax**(Expr, Var, lowBound, upBound) $\Rightarrow$ value**nfMax**(Expr, Var) | lowBound $\leq$ Var $\leq$ upBound $\Rightarrow$ value

Returns a candidate numerical value of variable Var where the local maximum of Expr occurs.

If you supply lowBound and upBound, the function looks in the closed interval [lowBound, upBound] for the local maximum.

nfMax ($-x^2 - 2 \cdot x - 1, x$)	-1.
nfMax ($0.5 \cdot x^3 - x - 2, x, -5, 5$)	-0.816497

nfMin()Catalog > **nfMin**(Expr, Var) $\Rightarrow$ value**nfMin**(Expr, Var, lowBound) $\Rightarrow$ value**nfMin**(Expr, Var, lowBound, upBound) $\Rightarrow$ value**nfMin**(Expr, Var) | lowBound $\leq$ Var $\leq$ upBound $\Rightarrow$ value

Returns a candidate numerical value of variable Var where the local minimum of Expr occurs.

If you supply lowBound and upBound, the function looks in the closed interval [lowBound, upBound] for the local minimum.

nfMin ($x^2 + 2 \cdot x + 5, x$)	-1.
nfMin ($0.5 \cdot x^3 - x - 2, x, -5, 5$)	0.816497

nInt()Catalog > **nInt**(Expr1, Var, Lower, Upper) $\Rightarrow$ expression

If the integrand Expr1 contains no variable other than Var, and if Lower and Upper are constants, positive ∞ , or negative ∞ , then **nInt()** returns an approximation of $\int(\text{Expr1}, \text{Var}, \text{Lower}, \text{Upper})$. This approximation is a weighted average of some sample values of the integrand in the interval $\text{Lower} < \text{Var} < \text{Upper}$.

The goal is six significant digits. The adaptive algorithm terminates when it seems likely that the goal has been achieved, or when it seems unlikely that additional samples will yield a worthwhile improvement.

A warning is displayed ("Questionable accuracy") when it seems that the goal has not been achieved.

Nest **nInt()** to do multiple numeric integration. Integration limits can depend on integration variables outside them.

nInt ($e^{-x^2}, x, 1, 1$)	1.49365
-------------------------------------	---------

nInt ($\cos(x), x, \pi, \pi + 1.E-12$)	-1.04144E-12
---	--------------

nInt (nInt ($\frac{e^{-x \cdot y}}{\sqrt{x^2 - y^2}}, y, -x, x$), $x, 0, 1$)	3.30423
--	---------

nom()	Catalog > 	
nom (<i>effectiveRate</i> , <i>CpY</i>) $\Rightarrow$ <i>value</i>	$\text{nom}(5.90398, 12)$	5.75
Financial function that converts the annual effective interest rate <i>effectiveRate</i> to a nominal rate, given <i>CpY</i> as the number of compounding periods per year.		
<i>effectiveRate</i> must be a real number, and <i>CpY</i> must be a real number > 0.		
Note: See also eff() , page 32.		

nor	ctrl = keys	
<i>BooleanExpr1</i> nor <i>BooleanExpr2</i> returns <i>Boolean expression</i>	$x \geq 3$ or $x \geq 4$	$x \geq 3$
<i>BooleanList1</i> nor <i>BooleanList2</i> returns <i>Boolean list</i>	$x \geq 3$ nor $x \geq 4$	$x < 3$
<i>BooleanMatrix1</i> nor <i>BooleanMatrix2</i> returns <i>Boolean matrix</i>		
Returns the negation of a logical or operation on the two arguments. Returns true, false, or a simplified form of the equation.		
For lists and matrices, returns comparisons element by element.		
<i>Integer1</i> nor <i>Integer2</i> $\Rightarrow$ <i>integer</i>	3 or 4	7
Compares two real integers bit-by-bit using a nor operation. Internally, both integers are converted to signed, 64-bit binary numbers. When corresponding bits are compared, the result is 1 if both bits are 1; otherwise, the result is 0. The returned value represents the bit results, and is displayed according to the Base mode.		
You can enter the integers in any number base. For a binary or hexadecimal entry, you must use the 0b or 0h prefix, respectively. Without a prefix, integers are treated as decimal (base 10).		
	3 nor 4	-8
	$\{1, 2, 3\}$ or $\{3, 2, 1\}$	$\{3, 2, 3\}$
	$\{1, 2, 3\}$ nor $\{3, 2, 1\}$	$\{-4, -3, -4\}$

norm()	Catalog > 	
norm (<i>Matrix</i>) $\Rightarrow$ <i>expression</i>	$\text{norm}\left(\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}\right)$	5.47723
norm (<i>Vector</i>) $\Rightarrow$ <i>expression</i>	$\text{norm}\left(\begin{bmatrix} 1 & 2 \end{bmatrix}\right)$	2.23607
Returns the Frobenius norm.		
	$\text{norm}\left(\begin{bmatrix} 1 \\ 2 \end{bmatrix}\right)$	2.23607

normCdf()	Catalog > 	
normCdf (<i>lowBound</i> , <i>upBound</i> , μ , σ) $\Rightarrow$ <i>number</i> if <i>lowBound</i> and <i>upBound</i> are numbers, <i>list</i> if <i>lowBound</i> and <i>upBound</i> are lists		
Computes the normal distribution probability between <i>lowBound</i> and <i>upBound</i> for the specified μ (default=0) and σ (default=1).		
For $P(X \leq \text{upBound})$, set <i>lowBound</i> = -9E999.		

normPdf()	Catalog > 	
normPdf (<i>XVal</i> , μ , σ) $\Rightarrow$ <i>number</i> if <i>XVal</i> is a number, <i>list</i> if <i>XVal</i> is a list		
Computes the probability density function for the normal distribution at a specified <i>XVal</i> value for the specified μ and σ .		

not

Catalog > 

not *BooleanExpr* $\Rightarrow$ *Boolean expression*

Returns true, false, or a simplified form of the argument.

not *Integer1* $\Rightarrow$ *integer*

Returns the one's complement of a real integer. Internally, *Integer1* is converted to a signed, 64-bit binary number. The value of each bit is flipped (0 becomes 1, and vice versa) for the one's complement. Results are displayed according to the Base mode.

You can enter the integer in any number base. For a binary or hexadecimal entry, you must use the 0b or 0h prefix, respectively. Without a prefix, the integer is treated as decimal (base 10).

If you enter a decimal integer that is too large for a signed, 64-bit binary form, a symmetric modulo operation is used to bring the value into the appropriate range. For more information, see **Base2**, page 12.

not (2 $\geq$ 3)	true
not 0hB0►Base16	0hFFFFFFFFFFFF4F
not not 2	2

In Hex base mode:

 **Important:** Zero, not the letter O.

not 0h7AC36	0hFFFFFFFF853C9
-------------	-----------------

In Bin base mode:

0b100101►Base10	37
not 0b100101	0b11111111111111111111111111111111►
not 0b100101►Base10	-38

To see the entire result, press  and then use  and  to move the cursor.

Note: A binary entry can have up to 64 digits (not counting the 0b prefix). A hexadecimal entry can have up to 16 digits.

nPr()

Catalog > 

nPr(*Value1*, *Value2*) $\Rightarrow$ *expression*

For integer *Value1* and *Value2* with $Value1 \geq Value2 \geq 0$, **nPr()** is the number of permutations of *Value1* things taken *Value2* at a time.

nPr(*Value*, 0) $\Rightarrow$ 1

nPr(*Value*, *negInteger*) $\Rightarrow$ $1/((Value+1) \cdot (Value+2) \dots (Value-negInteger))$

nPr(*Value*, *posInteger*) $\Rightarrow$ $Value \cdot (Value-1) \dots (Value-posInteger+1)$

nPr(*Value*, *nonInteger*) $\Rightarrow$ $Value! / (Value-nonInteger)!$

nPr(*List1*, *List2*) $\Rightarrow$ *list*

Returns a list of permutations based on the corresponding element pairs in the two lists. The arguments must be the same size list.

nPr(*Matrix1*, *Matrix2*) $\Rightarrow$ *matrix*

Returns a matrix of permutations based on the corresponding element pairs in the two matrices. The arguments must be the same size matrix.

nPr($\{z,3\}$), $z=5$	60
nPr($\{z,3\}$), $z=6$	120
nPr($\{\{5,4,3\}, \{2,4,2\}\}$)	$\{20,24,6\}$
nPr($\begin{bmatrix} 6 & 5 \\ 4 & 3 \end{bmatrix}, \begin{bmatrix} 2 & 2 \\ 2 & 2 \end{bmatrix}$)	$\begin{bmatrix} 30 & 20 \\ 12 & 6 \end{bmatrix}$

nPr($\{\{5,4,3\}, \{2,4,2\}\}$)	$\{20,24,6\}$
-----------------------------------	---------------

nPr($\begin{bmatrix} 6 & 5 \\ 4 & 3 \end{bmatrix}, \begin{bmatrix} 2 & 2 \\ 2 & 2 \end{bmatrix}$)	$\begin{bmatrix} 30 & 20 \\ 12 & 6 \end{bmatrix}$
---	---

npv()Catalog > **npv**(InterestRate,CFO,CFList,CFFreq)

Financial function that calculates net present value; the sum of the present values for the cash inflows and outflows. A positive result for npv indicates a profitable investment.

InterestRate is the rate by which to discount the cash flows (the cost of money) over one period.

CFO is the initial cash flow at time 0; it must be a real number.

CFList is a list of cash flow amounts after the initial cash flow *CFO*.

CFFreq is a list in which each element specifies the frequency of occurrence for a grouped (consecutive) cash flow amount, which is the corresponding element of *CFList*. The default is 1; if you enter values, they must be positive integers < 10,000.

$list1 := \{6000, -8000, 2000, -3000\}$	$\{6000, -8000, 2000, -3000\}$
$list2 := \{2, 2, 2, 1\}$	$\{2, 2, 2, 1\}$
$npv(10, 5000, list1, list2)$	4769.91

nSolve()Catalog > **nSolve**(Equation,Var[=Guess]) $\Rightarrow$ number or error_string**nSolve**(Equation,Var[=Guess],lowBound) $\Rightarrow$ number or error_string**nSolve**(Equation,Var[=Guess],lowBound,upBound) $\Rightarrow$ number or error_string**nSolve**(Equation,Var[=Guess]) | lowBound $\leq$ Var $\leq$ upBound $\Rightarrow$ number or error_string

Iteratively searches for one approximate real numeric solution to Equation for its one variable. Specify the variable as:

variable

– or –

variable = real number

For example, x is valid and so is $x=3$.

nSolve() attempts to determine either one point where the residual is zero or two relatively close points where the residual has opposite signs and the magnitude of the residual is not excessive. If it cannot achieve this using a modest number of sample points, it returns the string "no solution found."

$nSolve(x^2 + 5 \cdot x - 25 = 9, x)$	3.84429
$nSolve(x^2 = 4, x = -1)$	-2.
$nSolve(x^2 = 4, x = 1)$	2.

Note: If there are multiple solutions, you can use a guess to help find a particular solution.

$nSolve(x^2 + 5 \cdot x - 25 = 9, x) x < 0$	-8.84429
$nSolve\left(\frac{(1+r)^{24}-1}{r} = 26, r\right) r > 0 \text{ and } r < 0.25$	0.006886
$nSolve(x^2 = -1, x)$	"No solution found"

OneVar

Catalog > **OneVar** [1,]X[,][Freq][,Category,Include]]**OneVar** [n,]X1,X2[X3[,...[,X20]]]

Calculates 1-variable statistics on up to 20 lists. A summary of results is stored in the *stat.results* variable. (See page 98.)

All the lists must have equal dimension except for *Include*.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding *X* and *Y* data point. The default value is 1. All elements must be integers ≥ 0 .

Category is a list of numeric category codes for the corresponding *X* values.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

An empty (void) element in any of the lists *X*, *Freq*, or *Category* results in a void for the corresponding element of all those lists. An empty element in any of the lists *X1* through *X20* results in a void for the corresponding element of all those lists. For more information on empty elements, see page 132.

Output variable	Description
stat. $\bar{X}$	Mean of x values
stat. Σx	Sum of x values
stat. Σx^2	Sum of x^2 values
stat.sx	Sample standard deviation of x
stat. σx	Population standard deviation of x
stat.n	Number of data points
stat.MinX	Minimum of x values
stat.Q ₁ X	1st Quartile of x
stat.MedianX	Median of x
stat.Q ₃ X	3rd Quartile of x
stat.MaxX	Maximum of x values
stat.SSX	Sum of squares of deviations from the mean of x

or

Catalog >

BooleanExpr1 **or** *BooleanExpr2* returns *Boolean expression*
BooleanList1 **or** *BooleanList2* returns *Boolean list*
BooleanMatrix1 **or** *BooleanMatrix2* returns *Boolean matrix*

Returns true or false or a simplified form of the original entry.

Returns true if either or both expressions simplify to true. Returns false only if both expressions evaluate to false.

Note: See **xor**.

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing instead of at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

Integer1 **or** *Integer2* $\Rightarrow$ *integer*

Compares two real integers bit-by-bit using an or operation. Internally, both integers are converted to signed, 64-bit binary numbers. When corresponding bits are compared, the result is 1 if either bit is 1; the result is 0 only if both bits are 0. The returned value represents the bit results, and is displayed according to the Base mode.

You can enter the integers in any number base. For a binary or hexadecimal entry, you must use the 0b or 0h prefix, respectively. Without a prefix, integers are treated as decimal (base 10).

If you enter a decimal integer that is too large for a signed, 64-bit binary form, a symmetric modulo operation is used to bring the value into the appropriate range. For more information, see **Base2**, page 12.

Note: See **xor**.

Define $g(x) = \text{Func}$ Done
 If $x \leq 0$ or $x \geq 5$
 Goto *end*
 Return $x \cdot 3$
 Lbl *end*
 EndFunc

$g(3)$	9
$g(0)$	A function did not return a value

In Hex base mode:

0h7AC36 or 0h3D5F	0h7BD7F
-------------------	---------

Important: Zero, not the letter O.

In Bin base mode:

0b100101 or 0b100	0b100101
-------------------	----------

Note: A binary entry can have up to 64 digits (not counting the 0b prefix). A hexadecimal entry can have up to 16 digits.

ord()

Catalog >

ord(*String*) $\Rightarrow$ *integer*

ord(*List1*) $\Rightarrow$ *list*

Returns the numeric code of the first character in character string *String*, or a list of the first characters of each list element.

ord("hello")	104
char(104)	"h"
ord(char(24))	24
ord({"alpha", "beta"})	{97, 98}

P

P►Rx()

Catalog >

P►Rx(*rExpr*, θ *Expr*) $\Rightarrow$ *expression*

P►Rx(*rList*, θ *List*) $\Rightarrow$ *list*

P►Rx(*rMatrix*, θ *Matrix*) $\Rightarrow$ *matrix*

Returns the equivalent x-coordinate of the (*r*, θ) pair.

Note: The θ argument is interpreted as either a degree, gradian or radian angle, according to the current angle mode. If the argument is an expression, you can use $^{\circ}$, $^{\text{G}}$ or $^{\text{r}}$ to override the angle mode setting temporarily.

Note: You can insert this function from the computer keyboard by typing **P@►Rx**(...).

In Radian angle mode:

P►Rx (460 $^{\circ}$)	2.
-------------------------------	----

P►Rx ({-3, 10, 1.3}, { $\frac{\pi}{3}$, $\frac{\pi}{4}$, 0})	{-1.5, 7.07107, 1.3}
---	----------------------

P►Ry()Catalog > **P►Ry**(*rValue*, *θValue*) ⇒ *value***P►Ry**(*rList*, *θList*) ⇒ *list***P►Ry**(*rMatrix*, *θMatrix*) ⇒ *matrix*Returns the equivalent y-coordinate of the (*r*, *θ*) pair.**Note:** The *θ* argument is interpreted as either a degree, radian or gradian angle, according to the current angle mode.^{or}**Note:** You can insert this function from the computer keyboard by typing **P@>Ry** (...).

In Radian angle mode:

$$\text{P►Ry}(4, 60^\circ) \quad 3.4641$$
$$\text{P►Ry}\left\{-3, 10, 1.3\right\}, \left\{\frac{\pi}{3}, \frac{-\pi}{4}, 0\right\} \\ \left\{-2.59808, -7.07107, 0\right\}$$
PassErrCatalog > **PassErr**

Passes an error to the next level.

If system variable *errCode* is zero, **PassErr** does not do anything.The **Else** clause of the **Try...Else...EndTry** block should use **ClrErr** or **PassErr**. If the error is to be processed or ignored, use **ClrErr**. If what to do with the error is not known, use **PassErr** to send it to the next error handler. If there are no more pending **Try...Else...EndTry** error handlers, the error dialog box will be displayed as normal.**Note:** See also **ClrErr**, page 17, and **Try**, page 106.**Note for entering the example:** In the Calculator application on the handheld, you can enter multi-line definitions by pressing  instead of  at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.For an example of **PassErr**, See Example 2 under the **Try** command, page 106.**piecewise()**Catalog > **piecewise**(*Expr1* [, *Cond1* [, *Expr2* [, *Cond2* [, ...]]])

Returns definitions for a piecewise function in the form of a list. You can also create piecewise definitions by using a template.

Note: See also **Piecewise template**, page 2.Define $p(x) = \begin{cases} x, & x > 0 \\ \text{undef}, & x \leq 0 \end{cases}$ Done
$$p(1) \quad 1$$
$$p(-1) \quad \text{undef}$$
poissCdf()Catalog > **poissCdf**(*λ*, *lowBound*, *upBound*) ⇒ *number* if *lowBound* and *upBound* are numbers, *list* if *lowBound* and *upBound* are lists**poissCdf**(*λ*, *upBound*) for $P(0 \leq X \leq \text{upBound})$ ⇒ *number* if *upBound* is a number, *list* if *upBound* is a listComputes a cumulative probability for the discrete Poisson distribution with specified mean *λ*.For $P(X \leq \text{upBound})$, set *lowBound*=0**poissPdf()**Catalog > **poissPdf**(*λ*, *XVal*) ⇒ *number* if *XVal* is a number, *list* if *XVal* is a listComputes a probability for the discrete Poisson distribution with the specified mean *λ*.

►Polar

Catalog > 

Vector ►Polar

Note: You can insert this operator from the computer keyboard by typing @>Polar.

Displays *vector* in polar form $[r \angle \theta]$. The vector must be of dimension 2 and can be a row or a column.

Note: ►Polar is a display-format instruction, not a conversion function. You can use it only at the end of an entry line, and it does not update *ans*.

Note: See also ►Rect, page 82.

complexValue ►Polar

Displays *complexValue* in polar form.

- Degree angle mode returns $(r \angle \theta)$.
- Radian angle mode returns $re^{i\theta}$.

complexValue can have any complex form. However, an $re^{i\theta}$ entry causes an error in Degree angle mode.

Note: You must use the parentheses for an $(r \angle \theta)$ polar entry.

$$\begin{bmatrix} 1 & 3 \end{bmatrix} \blacktriangleright \text{Polar} \quad \begin{bmatrix} 3.16228 & \angle 71.5651 \end{bmatrix}$$

In Radian angle mode:

$$(3+4i) \blacktriangleright \text{Polar} \quad e^{.927295 \cdot i} \cdot 5$$

$$\left(4 \angle \frac{\pi}{3} \right) \blacktriangleright \text{Polar} \quad e^{1.0472 \cdot i} \cdot 4$$

In Gradian angle mode:

$$(4i) \blacktriangleright \text{Polar} \quad (4 \angle 100)$$

In Degree angle mode:

$$(3+4i) \blacktriangleright \text{Polar} \quad (5 \angle 53.1301)$$

polyEval()

Catalog > 

polyEval(List1, Expr1) $\Rightarrow$ *expression*

polyEval(List1, List2) $\Rightarrow$ *expression*

Interprets the first argument as the coefficient of a descending-degree polynomial, and returns the polynomial evaluated for the value of the second argument.

$$\text{polyEval}(\{1, 2, 3, 4\}, 2) \quad 26$$

$$\text{polyEval}(\{1, 2, 3, 4\}, \{2, -7\}) \quad \{26, -262\}$$

polyRoots()

Catalog > 

polyRoots(Poly, Var) $\Rightarrow$ *list*

polyRoots(ListOfCoeffs) $\Rightarrow$ *list*

The first syntax, **polyRoots**(Poly, Var), returns a list of real roots of polynomial *Poly* with respect to variable *Var*. If no real roots exist, returns an empty list: {}.

Poly must be a polynomial in expanded form in one variable. Do not use unexpanded forms such as $y^2 \cdot y + 1$ or $x \cdot x + 2 \cdot x + 1$.

The second syntax, **polyRoots**(ListOfCoeffs), returns a list of real roots for the coefficients in *ListOfCoeffs*.

Note: See also cPolyRoots(), page 23.

$$\text{polyRoots}(y^3+1, y) \quad \{-1\}$$

$$\text{cPolyRoots}(y^3+1, y) \quad \{-1, 0.5-0.866025i, 0.5+0.866025i\}$$

$$\text{polyRoots}(x^2+2 \cdot x+1, x) \quad \{-1, -1\}$$

$$\text{polyRoots}(\{1, 2, 1\}) \quad \{-1, -1\}$$

PowerReg *X*, *Y* [, *Freq*] [, *Category*, *Include*]

Computes the power regression $y = (a \cdot (x)^b)$ on lists *X* and *Y* with frequency *Freq*. A summary of results is stored in the *stat.results* variable. (See page 98.)

All the lists must have equal dimension except for *Include*.

X and *Y* are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding *X* and *Y* data point. The default value is 1. All elements must be integers ≥ 0 .

Category is a list of numeric or string category codes for the corresponding *X* and *Y* data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.RegEqn	Regression equation: $a \cdot (x)^b$
stat.a, stat.b	Regression coefficients
stat. r^2	Coefficient of linear determination for transformed data
stat.r	Correlation coefficient for transformed data ($\ln(x)$, $\ln(y)$)
stat.Resid	Residuals associated with the power model
stat.ResidTrans	Residuals associated with linear fit of transformed data
stat.XReg	List of data points in the modified <i>X List</i> actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.YReg	List of data points in the modified <i>Y List</i> actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.FreqReg	List of frequencies corresponding to <i>stat.XReg</i> and <i>stat.YReg</i>

PrgmCatalog > **Prgm***Block***EndPrgm**

Template for creating a user-defined program. Must be used with the **Define**, **Define LibPub**, or **Define LibPriv** command.

Block can be a single statement, a series of statements separated with the ";" character, or a series of statements on separate lines.

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing  instead of  at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

Calculate GCD and display intermediate results.

Define $\text{proggcd}(a,b) = \text{Prgm}$

```
Local d
While b≠0
d:=mod(a,b)
a:=b
b:=d
Disp a, " ", b
EndWhile
Disp "GCD=", a
EndPrgm
```

Done

$\text{proggcd}(4560,450)$

450 60

60 30

30 0

GCD=30

Done

prodSeq()See $\Pi()$, page 125.**Product (Pi)**See $\Pi()$, page 125.**product()**Catalog > 

$\text{product}(\text{List}[, \text{Start}[, \text{End}]]) \Rightarrow \text{expression}$

Returns the product of the elements contained in *List*. *Start* and *End* are optional. They specify a range of elements.

$\text{product}(\{1,2,3,4\})$ 24

$\text{product}(\{4,5,8,9\},2,3)$ 40

$\text{product}(\text{Matrix1}[, \text{Start}[, \text{End}]]) \Rightarrow \text{matrix}$

Returns a row vector containing the products of the elements in the columns of *Matrix1*. *Start* and *end* are optional. They specify a range of rows.

$\text{product}\left(\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}\right)$ $[28 \ 80 \ 162]$

Empty (void) elements are ignored. For more information on empty elements, see page 132.

$\text{product}\left(\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix},1,2\right)$ $[4 \ 10 \ 18]$

propFrac()

Catalog > 

propFrac(*Value1* [, *Var*]) $\Rightarrow$ *value*

propFrac(*rational_number*) returns *rational_number* as the sum of an integer and a fraction having the same sign and a greater denominator magnitude than numerator magnitude.

propFrac(*rational_expression*, *Var*) returns the sum of proper ratios and a polynomial with respect to *Var*. The degree of *Var* in the denominator exceeds the degree of *Var* in the numerator in each proper ratio. Similar powers of *Var* are collected. The terms and their factors are sorted with *Var* as the main variable.

If *Var* is omitted, a proper fraction expansion is done with respect to the most main variable. The coefficients of the polynomial part are then made proper with respect to their most main variable first and so on.

You can use the **propFrac()** function to represent mixed fractions and demonstrate addition and subtraction of mixed fractions.

$$\begin{array}{rcl} \text{propFrac}\left(\frac{4}{3}\right) & & 1 + \frac{1}{3} \\ \text{propFrac}\left(-\frac{4}{3}\right) & & -1 - \frac{1}{3} \end{array}$$

$$\begin{array}{rcl} \text{propFrac}\left(\frac{11}{7}\right) & & 1 + \frac{4}{7} \\ \text{propFrac}\left(3 + \frac{1}{11} + 5 + \frac{3}{4}\right) & & 8 + \frac{37}{44} \\ \text{propFrac}\left(3 + \frac{1}{11} - \left(5 + \frac{3}{4}\right)\right) & & -2 - \frac{29}{44} \end{array}$$

Q

QR

Catalog > 

QR *Matrix*, *qMatrix*, *rMatrix* [, *Tol*]

Calculates the Householder QR factorization of a real or complex matrix. The resulting Q and R matrices are stored to the specified *Matrix*. The Q matrix is unitary. The R matrix is upper triangular.

Optionally, any matrix element is treated as zero if its absolute value is less than *Tol*. This tolerance is used only if the matrix has floating-point entries and does not contain any symbolic variables that have not been assigned a value. Otherwise, *Tol* is ignored.

- If you use **ctrl** **enter** or set the **Auto or Approximate** mode to Approximate, computations are done using floating-point arithmetic.
- If *Tol* is omitted or not used, the default tolerance is calculated as:
 $5E-14 \cdot \max(\dim(\text{Matrix})) \cdot \text{rowNorm}(\text{Matrix})$

The floating-point number (9.) in m1 causes results to be calculated in floating-point form.

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9. \end{bmatrix} \rightarrow m1 \qquad \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9. \end{bmatrix}$$

QR *m1*, *qm*, *rm* Done

$$qm \quad \begin{bmatrix} 0.123091 & 0.904534 & 0.408248 \\ 0.492366 & 0.301511 & -0.816497 \\ 0.86164 & -0.301511 & 0.408248 \end{bmatrix}$$

$$rm \quad \begin{bmatrix} 8.12404 & 9.60114 & 11.0782 \\ 0. & 0.904534 & 1.80907 \\ 0. & 0. & 0. \end{bmatrix}$$

ClearAZ Done

The QR factorization is computed numerically using Householder transformations. The symbolic solution is computed using Gram-Schmidt. The columns in *qMatName* are the orthonormal basis vectors that span the space defined by *matrix*.

QuadReg X, Y [, $Freq$] [, $Category$, $Include$]

Computes the quadratic polynomial regression $y = a \cdot x^2 + b \cdot x + c$ on lists X and Y with frequency $Freq$. A summary of results is stored in the *stat.results* variable. (See page 98.)

All the lists must have equal dimension except for *Include*.

X and Y are lists of independent and dependent variables.

$Freq$ is an optional list of frequency values. Each element in $Freq$ specifies the frequency of occurrence for each corresponding X and Y data point. The default value is 1. All elements must be integers ≥ 0 .

$Category$ is a list of numeric or string category codes for the corresponding X and Y data.

$Include$ is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.RegEqn	Regression equation: $a \cdot x^2 + b \cdot x + c$
stat.a, stat.b, stat.c	Regression coefficients
stat.R ²	Coefficient of determination
stat.Resid	Residuals from the regression
stat.XReg	List of data points in the modified X List actually used in the regression based on restrictions of $Freq$, $Category$ List, and $Include$ Categories
stat.YReg	List of data points in the modified Y List actually used in the regression based on restrictions of $Freq$, $Category$ List, and $Include$ Categories
stat.FreqReg	List of frequencies corresponding to $stat.XReg$ and $stat.YReg$

QuartReg**QuartReg** X, Y [, $Freq$] [, $Category$, $Include$]

Computes the quartic polynomial regression

$y = a \cdot x^4 + b \cdot x^3 + c \cdot x^2 + d \cdot x + e$ on lists X and Y with frequency $Freq$. A summary of results is stored in the *stat.results* variable. (See page 98.)

All the lists must have equal dimension except for *Include*.

X and Y are lists of independent and dependent variables.

$Freq$ is an optional list of frequency values. Each element in $Freq$ specifies the frequency of occurrence for each corresponding X and Y data point. The default value is 1. All elements must be integers ≥ 0 .

$Category$ is a list of numeric or string category codes for the corresponding X and Y data.

$Include$ is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.RegEqn	Regression equation: $a \cdot x^4 + b \cdot x^3 + c \cdot x^2 + d \cdot x + e$
stat.a, stat.b, stat.c, stat.d, stat.e	Regression coefficients
stat.R ²	Coefficient of determination
stat.Resid	Residuals from the regression
stat.XReg	List of data points in the modified <i>X List</i> actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.YReg	List of data points in the modified <i>Y List</i> actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.FreqReg	List of frequencies corresponding to <i>stat.XReg</i> and <i>stat.YReg</i>

R

R►Pθ()

Catalog > 

R►Pθ (xValue, yValue) $\Rightarrow$ value

R►Pθ (xList, yList) $\Rightarrow$ list

R►Pθ (xMatrix, yMatrix) $\Rightarrow$ matrix

Returns the equivalent θ -coordinate of the (x,y) pair arguments.

Note: The result is returned as a degree, gradian or radian angle, according to the current angle mode setting.

Note: You can insert this function from the computer keyboard by typing **R@>Ptheta**(...).

In Degree angle mode:

$$\text{R►P}\theta(2,2) \quad 45.$$

In Gradian angle mode:

$$\text{R►P}\theta(2,2) \quad 50.$$

In Radian angle mode:

$$\text{R►P}\theta(3,2) \quad 0.588003$$

$$\text{R►P}\theta\left(\begin{bmatrix} 3 & -4 & 2 \end{bmatrix}, \begin{bmatrix} 0 & \frac{\pi}{4} & 1.5 \end{bmatrix}\right) \quad \begin{bmatrix} 0. & 2.94771 & 0.643501 \end{bmatrix}$$

R►Pr()

Catalog > 

R►Pr (xValue, yValue) $\Rightarrow$ value

R►Pr (xList, yList) $\Rightarrow$ list

R►Pr (xMatrix, yMatrix) $\Rightarrow$ matrix

Returns the equivalent r -coordinate of the (x,y) pair arguments.

Note: You can insert this function from the computer keyboard by typing **R@>Pr**(...).

In Radian angle mode:

$$\text{R►Pr}(3,2) \quad 3.60555$$

$$\text{R►Pr}\left(\begin{bmatrix} 3 & -4 & 2 \end{bmatrix}, \begin{bmatrix} 0 & \frac{\pi}{4} & 1.5 \end{bmatrix}\right) \quad \begin{bmatrix} 3 & 4.07638 & \frac{5}{2} \end{bmatrix}$$

►Rad

Catalog >

Value ►Rad $\Rightarrow$ *value*

Converts the argument to radian angle measure.

Note: You can insert this operator from the computer keyboard by typing @>Rad.

In Degree angle mode:

$(1.5) \blacktriangleright \text{Rad}$	$(0.02618)^{\circ}$
--	---------------------

In Gradian angle mode:

$(1.5) \blacktriangleright \text{Rad}$	$(0.023562)^{\circ}$
--	----------------------

rand()

Catalog >

rand() $\Rightarrow$ *expression*

rand(#Trials) $\Rightarrow$ *list*

rand() returns a random value between 0 and 1.

rand(#Trials) returns a list containing #Trials random values between 0 and 1.

└ Sets the random-number seed.

RandSeed 1147	Done
rand(2)	{ 0.158206, 0.717917 }

randBin()

Catalog >

randBin(*n*, *p*) $\Rightarrow$ *expression*

randBin(*n*, *p*, #Trials) $\Rightarrow$ *list*

randBin(*n*, *p*) returns a random real number from a specified Binomial distribution.

randBin(*n*, *p*, #Trials) returns a list containing #Trials random real numbers from a specified Binomial distribution.

randBin(80,.5)	34.
randBin(80,.5,3)	{ 47., 41., 46. }

randInt()

Catalog >

randInt(*lowBound*, *upBound*) $\Rightarrow$ *expression*

randInt(*lowBound*, *upBound*, #Trials) $\Rightarrow$ *list*

randInt(*lowBound*, *upBound*) returns a random integer within the range specified by *lowBound* and *upBound* integer bounds.

randInt(*lowBound*, *upBound*, #Trials) returns a list containing #Trials random integers within the specified range.

randInt(3,10)	7.
randInt(3,10,4)	{ 8., 9., 4., 4. }

randMat()

Catalog >

randMat(*numRows*, *numColumns*) $\Rightarrow$ *matrix*

Returns a matrix of integers between -9 and 9 of the specified dimension.

Both arguments must simplify to integers.

RandSeed 1147	Done									
randMat(3,3)	<table border="1"> <tr><td>8</td><td>-3</td><td>6</td></tr> <tr><td>-2</td><td>3</td><td>-6</td></tr> <tr><td>0</td><td>4</td><td>-6</td></tr> </table>	8	-3	6	-2	3	-6	0	4	-6
8	-3	6								
-2	3	-6								
0	4	-6								

Note: The values in this matrix will change each time you press .

randNorm()

Catalog >

randNorm(μ , σ) $\Rightarrow$ *expression*

randNorm(μ , σ , #Trials) $\Rightarrow$ *list*

randNorm(μ , σ) returns a decimal number from the specified normal distribution. It could be any real number but will be heavily concentrated in the interval $[\mu - 3 \cdot \sigma, \mu + 3 \cdot \sigma]$.

randNorm(μ , σ , #Trials) returns a list containing #Trials decimal numbers from the specified normal distribution.

RandSeed 1147	Done
randNorm(0,1)	0.492541
randNorm(3,4.5)	-3.54356

randPoly()	Catalog >
randPoly (Var, Order) $\Rightarrow$ expression	
Returns a polynomial in Var of the specified Order. The coefficients are random integers in the range -9 through 9. The leading coefficient will not be zero.	
Order must be 0–99.	
	RandSeed 1147 Done randPoly(x,5) $-2 \cdot x^5 + 3 \cdot x^4 - 6 \cdot x^3 + 4 \cdot x - 6$

randSamp()	Catalog >
randSamp (List,#Trials[,noRepl]) $\Rightarrow$ list	
Returns a list containing a random sample of #Trials trials from List with an option for sample replacement (noRepl=0), or no sample replacement (noRepl=1). The default is with sample replacement.	
	Define list3={1,2,3,4,5} Done Define list4=randSamp(list3,6) Done list4 {5,1,3,3,4,4}

RandSeed	Catalog >
RandSeed Number	
If Number = 0, sets the seeds to the factory defaults for the random-number generator. If Number $\neq$ 0, it is used to generate two seeds, which are stored in system variables seed1 and seed2.	
	RandSeed 1147 Done rand() 0.158206

real()	Catalog >
real (Value1) $\Rightarrow$ value	
Returns the real part of the argument.	
real (List1) $\Rightarrow$ list	
Returns the real parts of all elements.	
real (Matrix1) $\Rightarrow$ matrix	
Returns the real parts of all elements.	
	real(2+3<i>i</i>) 2 real({1+3<i>i</i>,3,<i>i</i>}) {1,3,0} real($\begin{bmatrix} 1+3 \cdot i & 3 \\ 2 & i \end{bmatrix}$) $\begin{bmatrix} 1 & 3 \\ 2 & 0 \end{bmatrix}$

►Rect	Catalog >
Vector ►Rect	
Note: You can insert this operator from the computer keyboard by typing @>Rect.	
Displays Vector in rectangular form [x, y, z]. The vector must be of dimension 2 or 3 and can be a row or a column.	
Note: ►Rect is a display-format instruction, not a conversion function. You can use it only at the end of an entry line, and it does not update ans.	
Note: See also ►Polar, page 75.	
	$\left(\left[3 \angle \frac{\pi}{4} \angle \frac{\pi}{6} \right] \right) \blacktriangleright \text{Rect}$ $[1.06066 \quad 1.06066 \quad 2.59808]$

►Rect

Catalog > 

complexValue ►Rect

Displays *complexValue* in rectangular form $a+bi$. The *complexValue* can have any complex form. However, an $re^{i\theta}$ entry causes an error in Degree angle mode.

Note: You must use parentheses for an $(r\angle\theta)$ polar entry.

In Radian angle mode:

$$\left(\left(4 \cdot e^{\frac{\pi}{3}} \right) \right) \blacktriangleright \text{Rect} \quad 11.3986$$

$$\left(\left(4 \angle \frac{\pi}{3} \right) \right) \blacktriangleright \text{Rect} \quad 2.+3.4641 \cdot i$$

In Gradian angle mode:

$$\left(\left(1 \angle 100 \right) \right) \blacktriangleright \text{Rect} \quad i$$

In Degree angle mode:

$$\left(\left(4 \angle 60 \right) \right) \blacktriangleright \text{Rect} \quad 2.+3.4641 \cdot i$$

Note: To type $\angle$, select it from the symbol list in the Catalog.

ref()

Catalog > 

ref(*Matrix1*[, *Tol*]) $\Rightarrow$ *matrix*

Returns the row echelon form of *Matrix1*.

Optionally, any matrix element is treated as zero if its absolute value is less than *Tol*. This tolerance is used only if the matrix has floating-point entries and does not contain any symbolic variables that have not been assigned a value. Otherwise, *Tol* is ignored.

- If you use **ctrl** **enter** or set the **Auto or Approximate** mode to Approximate, computations are done using floating-point arithmetic.
- If *Tol* is omitted or not used, the default tolerance is calculated as:
 $5E-14 \cdot \max(\dim(\text{Matrix1})) \cdot \text{rowNorm}(\text{Matrix1})$

Avoid undefined elements in *Matrix1*. They can lead to unexpected results.

For example, if *a* is undefined in the following expression, a warning message appears and the result is shown as:

$$\text{ref} \left(\begin{bmatrix} a & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \Rightarrow \begin{bmatrix} 1 & \frac{1}{a} & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

The warning appears because the generalized element $1/a$ would not be valid for $a=0$.

You can avoid this by storing a value to *a* beforehand or by using the constraint ("|") operator to substitute a value, as shown in the following example.

$$\text{ref} \left(\begin{bmatrix} a & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \mid a=0 \right) \Rightarrow \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix}$$

Note: See also **rref()**, page 88.

$$\text{ref} \left(\begin{bmatrix} -2 & -2 & 0 & -6 \\ 1 & -1 & 9 & -9 \\ -5 & 2 & 4 & -4 \end{bmatrix} \right) \Rightarrow \begin{bmatrix} 1 & \frac{-2}{5} & \frac{-4}{5} & \frac{4}{5} \\ 0 & 1 & \frac{4}{7} & \frac{11}{7} \\ 0 & 0 & 1 & \frac{-62}{71} \end{bmatrix}$$

remain()

Catalog > 

remain(Value1, Value2) $\Rightarrow$ value

remain(List1, List2) $\Rightarrow$ list

remain(Matrix1, Matrix2) $\Rightarrow$ matrix

Returns the remainder of the first argument with respect to the second argument as defined by the identities:

$\text{remain}(x, 0) \equiv x$

$\text{remain}(x, y) \equiv x - y \cdot \text{iPart}(x/y)$

As a consequence, note that **remain**(-x,y) = -**remain**(x,y). The result is either zero or it has the same sign as the first argument.

Note: See also **mod()**, page 64.

$\text{remain}(7, 0)$	7
$\text{remain}(7, 3)$	1
$\text{remain}(-7, 3)$	-1
$\text{remain}(7, -3)$	1
$\text{remain}(-7, -3)$	-1
$\text{remain}(\{12, 14, 16\}, \{9, 7, 5\})$	$\{3, 0, 1\}$
$\text{remain}\left(\begin{bmatrix} 9 & -7 \\ 6 & 4 \end{bmatrix}, \begin{bmatrix} 4 & 3 \\ 4 & -3 \end{bmatrix}\right)$	$\begin{bmatrix} 1 & -1 \\ 2 & 1 \end{bmatrix}$

Request

Catalog > 

Request promptString, var[, DispFlag [, statusVar]]

Request promptString, func(arg1, ...argn)
[, DispFlag [, statusVar]]

Programming command: Pauses the program and displays a dialog box containing the message *promptString* and an input box for the user's response.

When the user types a response and clicks **OK**, the contents of the input box are assigned to variable *var*.

If the user clicks **Cancel**, the program proceeds without accepting any input. The program uses the previous value of *var* if *var* was already defined.

The optional *DispFlag* argument can be any expression.

- If *DispFlag* is omitted or evaluates to **1**, the prompt message and user's response are displayed in the Calculator history.
- If *DispFlag* evaluates to **0**, the prompt and response are not displayed in the history.

The optional *statusVar* argument gives the program a way to determine how the user dismissed the dialog box. Note that *statusVar* requires the *DispFlag* argument.

- If the user clicked **OK** or pressed **Enter** or **Ctrl-Enter**, variable *statusVar* is set to a value of **1**.
- Otherwise, variable *statusVar* is set to a value of **0**.

The *func()* argument allows a program to store the user's response as a function definition. This syntax operates as if the user executed the command:

Define *func*(arg1, ...argn) = user's response

The program can then use the defined function *func()*. The *promptString* should guide the user to enter an appropriate user's response that completes the function definition.

Note: You can use the **Request** command within a user-defined program but not within a function.

To stop a program that contains a **Request** command inside an infinite loop:

- **Windows®:** Hold down the **F12** key and press **Enter** repeatedly.
- **Macintosh®:** Hold down the **F5** key and press **Enter** repeatedly.
- **Handheld:** Hold down the  key and press  repeatedly.

Note: See also **RequestStr**, page 85.

Define a program:

Define request_demo()=Prgm

Request "Radius: ",r

Disp "Area = ",pi*r^2

EndPrgm

Run the program and type a response:

request_demo()

Result after selecting **OK**:

Radius: 6/2

Area= 28.2743

Define a program:

Define polynomial()=Prgm

Request "Enter a polynomial in x:",p(x)

Disp "Real roots are:",polyRoots(p(x),x)

EndPrgm

Run the program and type a response:

polynomial()

Result after selecting **OK**:

Enter a polynomial in x: x^3+3x+1

Real roots are: {-0.322185}

RequestStr

Catalog >

RequestStr *promptString*, *var* [, *DispFlag*]

Programming command: Operates identically to the first syntax of the **Request** command, except that the user's response is always interpreted as a string. By contrast, the **Request** command interprets the response as an expression unless the user encloses it in quotation marks ("").

Note: You can use the **RequestStr** command within a user-defined program but not within a function.

To stop a program that contains a **RequestStr** command inside an infinite loop:

- **Windows®:** Hold down the **F12** key and press **Enter** repeatedly.
- **Macintosh®:** Hold down the **F5** key and press **Enter** repeatedly.
- **Handheld:** Hold down the key and press repeatedly.

Note: See also **Request**, page 84.

Define a program:

```
Define requestStr_demo()=Prgm
RequestStr "Your name:",name,0
Disp "Response has ",dim(name)," characters."
EndPrgm
```

Run the program and type a response:

requestStr_demo()

Result after selecting **OK** (Note that the *DispFlag* argument of **0** omits the prompt and response from the history):

requestStr_demo()

Response has 5 characters.

Return

Catalog >

Return [*Expr*]

Returns *Expr* as the result of the function. Use within a **Func...EndFunc** block.

Note: Use **Return** without an argument within a **Prgm...EndPrgm** block to exit a program.

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing instead of at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

Define $factoral(nm)=Func$

Local answer,count

1 → answer

For count,1,nm

answer·count → answer

EndFor

Return answer

EndFunc

Done

$factoral(3)$

6

right()

Catalog >

right(*List1* [, *Num*]) ⇒ *list*

Returns the rightmost *Num* elements contained in *List1*.

If you omit *Num*, returns all of *List1*.

right(*sourceString* [, *Num*]) ⇒ *string*

Returns the rightmost *Num* characters contained in character string *sourceString*.

If you omit *Num*, returns all of *sourceString*.

right(*Comparison*) ⇒ *expression*

Returns the right side of an equation or inequality.

$right(\{1,3,-2,4\},3)$

$\{3,-2,4\}$

$right("Hello",2)$

"lo"

rk23()

Catalog >

rk23(Expr, Var, depVar, {Var0, VarMax}, depVar0, VarStep [, diftol]) $\Rightarrow$ matrix

rk23(SystemOfExpr, Var, ListOfDepVars, {Var0, VarMax}, ListOfDepVars0, VarStep [, diftol]) $\Rightarrow$ matrix

rk23(ListOfExpr, Var, ListOfDepVars, {Var0, VarMax}, ListOfDepVars0, VarStep [, diftol]) $\Rightarrow$ matrix

Uses the Runge-Kutta method to solve the system

$$\frac{d \text{ depVar}}{d \text{ Var}} = \text{Expr}(\text{Var}, \text{depVar})$$

with $\text{depVar}(\text{Var0}) = \text{depVar0}$ on the interval $[\text{Var0}, \text{VarMax}]$. Returns a matrix whose first row defines the Var output values as defined by VarStep. The second row defines the value of the first solution component at the corresponding Var values, and so on.

Expr is the right hand side that defines the ordinary differential equation (ODE).

SystemOfExpr is a system of right-hand sides that define the system of ODEs (corresponds to order of dependent variables in ListOfDepVars).

ListOfExpr is a list of right-hand sides that define the system of ODEs (corresponds to order of dependent variables in ListOfDepVars).

Var is the independent variable.

ListOfDepVars is a list of dependent variables.

{Var0, VarMax} is a two-element list that tells the function to integrate from Var0 to VarMax.

ListOfDepVars0 is a list of initial values for dependent variables.

If VarStep evaluates to a nonzero number: $\text{sign}(\text{VarStep}) = \text{sign}(\text{VarMax} - \text{Var0})$ and solutions are returned at $\text{Var0} + i * \text{VarStep}$ for all $i=0,1,2,\dots$ such that $\text{Var0} + i * \text{VarStep}$ is in $[\text{var0}, \text{VarMax}]$ (may not get a solution value at VarMax).

if VarStep evaluates to zero, solutions are returned at the "Runge-Kutta" Var values.

diftol is the error tolerance (defaults to 0.001).

Differential equation:

$$y' = 0.001 * y * (100 - y) \text{ and } y(0) = 10$$

$$\text{rk23}(0.001 \cdot y \cdot (100 - y), t, y, \{0, 100\}, 10, 1) \begin{bmatrix} 0. & 1. & 2. & 3. & 4. \\ 10. & 10.9367 & 11.9493 & 13.042 & 14.2 \end{bmatrix}$$

To see the entire result, press $\blacktriangle$ and then use $\blacktriangleleft$ and $\blacktriangleright$ to move the cursor.

Same equation with diftol set to $1.E-6$

$$\text{rk23}(0.001 \cdot y \cdot (100 - y), t, y, \{0, 100\}, 10, 1, 1.E-6) \begin{bmatrix} 0. & 1. & 2. & 3. & 4. \\ 10. & 10.9367 & 11.9495 & 13.0423 & 14.2189 \end{bmatrix}$$

System of equations:

$$y1' = -y1 + 0.1 \cdot y1 \cdot y2$$

$$y2' = 3 \cdot y2 - y1 \cdot y2$$

with $y1(0) = 2$ and $y2(0) = 5$

$$\text{rk23}\left(\begin{bmatrix} -y1 + 0.1 \cdot y1 \cdot y2 \\ 3 \cdot y2 - y1 \cdot y2 \end{bmatrix}, t, \{y1, y2\}, \{0, 5\}, \{2, 5\}, 1\right) \begin{bmatrix} 0. & 1. & 2. & 3. & 4. \\ 2. & 1.94103 & 4.78694 & 3.25253 & 1.82848 \\ 5. & 16.8311 & 12.3133 & 3.51112 & 6.27245 \end{bmatrix}$$

root()

Catalog >

root(Value) $\Rightarrow$ root

root(Value1, Value2) $\Rightarrow$ root

root(Value) returns the square root of Value.

root(Value1, Value2) returns the Value2 root of Value1. Value1 can be a real or complex floating point constant or an integer or complex rational constant.

Note: See also **Nth root template**, page 1.

$$\begin{array}{r} \sqrt[3]{8} \\ \hline 2 \end{array} \quad \begin{array}{r} \sqrt[3]{3} \\ \hline 1.44225 \end{array}$$

rotate()

Catalog >

rotate(Integer1[, #ofRotations]) $\Rightarrow$ integer

Rotates the bits in a binary integer. You can enter Integer1 in any number base; it is converted automatically to a signed, 64-bit binary form. If the magnitude of Integer1 is too large for this form, a symmetric modulo operation brings it within the range. For more information, see **Base2**, page 12.

In Bin base mode:

$$\begin{array}{l} \text{rotate}(0b11111111111111111111111111111111) \\ 0b1000000000000000000000000000000000001 \\ \hline \text{rotate}(256, 1) \end{array} \quad 0b1000000000$$

To see the entire result, press $\blacktriangle$ and then use $\blacktriangleleft$ and $\blacktriangleright$ to move the cursor.

rotate()Catalog > 

If *#ofRotations* is positive, the rotation is to the left. If *#ofRotations* is negative, the rotation is to the right. The default is -1 (rotate right one bit).

For example, in a right rotation:

Each bit rotates right.

0b00000000000001111010110000110101

Rightmost bit rotates to leftmost.

produces:

0b10000000000001111010110000110101

The result is displayed according to the Base mode.

rotate(List1[,#ofRotations]) $\Rightarrow$ list

Returns a copy of *List1* rotated right or left by *#ofRotations* elements. Does not alter *List1*.

If *#ofRotations* is positive, the rotation is to the left. If *#ofRotations* is negative, the rotation is to the right. The default is -1 (rotate right one element).

rotate(String1[,#ofRotations]) $\Rightarrow$ string

Returns a copy of *String1* rotated right or left by *#ofRotations* characters. Does not alter *String1*.

If *#ofRotations* is positive, the rotation is to the left. If *#ofRotations* is negative, the rotation is to the right. The default is -1 (rotate right one character).

In Hex base mode:

rotate(0h78E)	0h3C7
rotate(0h78E,-2)	0h80000000000001E3
rotate(0h78E,2)	0h1E38

Important: To enter a binary or hexadecimal number, always use the 0b or 0h prefix (zero, not the letter O).

In Dec base mode:

rotate({1,2,3,4})	{4,1,2,3}
rotate({1,2,3,4},2)	{3,4,1,2}
rotate({1,2,3,4},1)	{2,3,4,1}
rotate("abcd")	"dabc"
rotate("abcd",-2)	"cdab"
rotate("abcd",1)	"bcda"

round()Catalog > 

round(Value1[,digits]) $\Rightarrow$ value

Returns the argument rounded to the specified number of digits after the decimal point.

digits must be an integer in the range 0–12. If *digits* is not included, returns the argument rounded to 12 significant digits.

Note: Display digits mode may affect how this is displayed.

round(List1[,digits]) $\Rightarrow$ list

Returns a list of the elements rounded to the specified number of digits.

round(Matrix1[,digits]) $\Rightarrow$ matrix

Returns a matrix of the elements rounded to the specified number of digits.

round(1.234567,3)	1.235
-------------------	-------

round({ π , $\sqrt{2}$,ln(2)},4)	{3.1416,1.4142,0.6931}
---------------------------------------	------------------------

round($\begin{bmatrix} \ln(5) & \ln(3) \\ \pi & e^1 \end{bmatrix}$,1)	$\begin{bmatrix} 1.6 & 1.1 \\ 3.1 & 2.7 \end{bmatrix}$
---	--

rowAdd()Catalog > 

rowAdd(Matrix1,rIndex1,rIndex2) $\Rightarrow$ matrix

Returns a copy of *Matrix1* with row *rIndex2* replaced by the sum of rows *rIndex1* and *rIndex2*.

rowAdd($\begin{bmatrix} 3 & 4 \\ -3 & -2 \end{bmatrix}$,1,2)	$\begin{bmatrix} 3 & 4 \\ 0 & 2 \end{bmatrix}$
--	--

rowDim()Catalog > **rowDim**(*Matrix*) $\Rightarrow$ *expression*Returns the number of rows in *Matrix*.**Note:** See also **colDim()**, page 17.

$\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix} \rightarrow m1$	$\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix}$
rowDim (<i>m1</i>)	3

rowNorm()Catalog > **rowNorm**(*Matrix*) $\Rightarrow$ *expression*Returns the maximum of the sums of the absolute values of the elements in the rows in *Matrix*.**Note:** All matrix elements must simplify to numbers. See also **colNorm()**, page 17.

rowNorm $\left(\begin{bmatrix} -5 & 6 & -7 \\ 3 & 4 & 9 \\ 9 & -9 & -7 \end{bmatrix}\right)$	25
---	----

rowSwap()Catalog > **rowSwap**(*Matrix1*, *rIndex1*, *rIndex2*) $\Rightarrow$ *matrix*Returns *Matrix1* with rows *rIndex1* and *rIndex2* exchanged.

$\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix} \rightarrow mat$	$\begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{bmatrix}$
rowSwap (<i>mat</i> ,1,3)	$\begin{bmatrix} 5 & 6 \\ 3 & 4 \\ 1 & 2 \end{bmatrix}$

rref()Catalog > **rref**(*Matrix1*[, *Tol*]) $\Rightarrow$ *matrix*Returns the reduced row echelon form of *Matrix1*.

rref $\left(\begin{bmatrix} -2 & -2 & 0 & -6 \\ 1 & -1 & 9 & -9 \\ -5 & 2 & 4 & -4 \end{bmatrix}\right)$	$\begin{bmatrix} 1 & 0 & 0 & \frac{66}{71} \\ 0 & 1 & 0 & \frac{147}{71} \\ 0 & 0 & 1 & \frac{-62}{71} \end{bmatrix}$
---	---

Optionally, any matrix element is treated as zero if its absolute value is less than *Tol*. This tolerance is used only if the matrix has floating-point entries and does not contain any symbolic variables that have not been assigned a value. Otherwise, *Tol* is ignored.

- If you use   or set the **Auto or Approximate** mode to Approximate, computations are done using floating-point arithmetic.
- If *Tol* is omitted or not used, the default tolerance is calculated as:
 $5E-14 \cdot \max(\dim(\text{Matrix1})) \cdot \text{rowNorm}(\text{Matrix1})$

Note: See also **rref()**, page 83.

S

sec()

 **key**

sec(*Value1*) $\Rightarrow$ *value*

sec(*List1*) $\Rightarrow$ *list*

Returns the secant of *Value1* or returns a list containing the secants of all elements in *List1*.

Note: The argument is interpreted as a degree, gradian or radian angle, according to the current angle mode setting. You can use $^{\circ}$, $^{\text{G}}$, or $^{\text{R}}$ to override the angle mode temporarily.

In Degree angle mode:

$$\text{sec}(45) \quad 1.41421$$

$$\text{sec}(\{1, 2, 3, 4\}) \quad \{1.00015, 1.00081, 1.00244\}$$

sec⁻¹()

 **key**

sec⁻¹(*Value1*) $\Rightarrow$ *value*

sec⁻¹(*List1*) $\Rightarrow$ *list*

Returns the angle whose secant is *Value1* or returns a list containing the inverse secants of each element of *List1*.

Note: The result is returned as a degree, gradian or radian angle, according to the current angle mode setting.

Note: You can insert this function from the keyboard by typing **arcsec**(...).

In Degree angle mode:

$$\text{sec}^{-1}(1) \quad 0$$

In Gradian angle mode:

$$\text{sec}^{-1}(\sqrt{2}) \quad 50$$

In Radian angle mode:

$$\text{sec}^{-1}(\{1, 2, 5\}) \quad \{0, 1.0472, 1.36944\}$$

sech()

Catalog > 

sech(*Value1*) $\Rightarrow$ *value*

sech(*List1*) $\Rightarrow$ *list*

Returns the hyperbolic secant of *Value1* or returns a list containing the hyperbolic secants of the *List1* elements.

$$\text{sech}(3) \quad 0.099328$$

$$\text{sech}(\{1, 2, 3, 4\}) \quad \{0.648054, 0.198522, 0.036619\}$$

sech⁻¹()

Catalog > 

sech⁻¹(*Value1*) $\Rightarrow$ *value*

sech⁻¹(*List1*) $\Rightarrow$ *list*

Returns the inverse hyperbolic secant of *Value1* or returns a list containing the inverse hyperbolic secants of each element of *List1*.

Note: You can insert this function from the keyboard by typing **arcsech**(...).

In Radian angle and Rectangular complex mode:

$$\text{sech}^{-1}(1) \quad 0$$

$$\text{sech}^{-1}(\{1, -2, 2, 1\}) \quad \{0, 2.0944 - i, 8. \text{E} - 15 + 1.07448 \cdot i\}$$

seq()Catalog > **seq**(Expr, Var, Low, High[, Step]) $\Rightarrow$ list

Increments Var from Low through High by an increment of Step, evaluates Expr, and returns the results as a list. The original contents of Var are still there after **seq()** is completed.

The default value for Step = 1.

$$\text{seq}\left(n^2, n, 1, 6\right) \quad \left\{1, 4, 9, 16, 25, 36\right\}$$

$$\text{seq}\left(\frac{1}{n}, n, 1, 10, 2\right) \quad \left\{1, \frac{1}{3}, \frac{1}{5}, \frac{1}{7}, \frac{1}{9}\right\}$$

$$\text{sum}\left(\text{seq}\left(\frac{1}{n^2}, n, 1, 10, 1\right)\right) \quad \frac{1968329}{1270080}$$

Press **Ctrl+Enter**   (Macintosh®:  + **Enter**) to evaluate:

$$\text{sum}\left(\text{seq}\left(\frac{1}{n^2}, n, 1, 10, 1\right)\right) \quad 1.54977$$

seqGen()Catalog > 
seqGen(Expr, Var, depVar, {Var0, VarMax}[, ListOfInitTerms[, VarStep[, CeilingValue]]]) $\Rightarrow$ list

Generates a list of terms for sequence $\text{depVar}(\text{Var}) = \text{Expr}$ as follows: Increments independent variable Var from Var0 through VarMax by VarStep, evaluates $\text{depVar}(\text{Var})$ for corresponding values of Var using the Expr formula and ListOfInitTerms, and returns the results as a list.

seqGen(ListOrSystemOfExpr, Var, ListOfDepVars, {Var0, VarMax}[, MatrixOfInitTerms[, VarStep[, CeilingValue]]]) $\Rightarrow$ matrix

Generates a matrix of terms for a system (or list) of sequences $\text{ListOfDepVars}(\text{Var}) = \text{ListOrSystemOfExpr}$ as follows: Increments independent variable Var from Var0 through VarMax by VarStep, evaluates $\text{ListOfDepVars}(\text{Var})$ for corresponding values of Var using ListOrSystemOfExpr formula and MatrixOfInitTerms, and returns the results as a matrix.

The original contents of Var are unchanged after **seqGen()** is completed.

The default value for VarStep = 1.

Generate the first 5 terms of the sequence $u(n) = u(n-1)^2/2$, with $u(1)=2$ and $\text{VarStep}=1$.

$$\text{seqGen}\left(\frac{u(n-1)^2}{n}, n, u, \{1, 5\}, \{2\}\right) \quad \left\{2, 2, \frac{4}{3}, \frac{4}{9}, \frac{16}{405}\right\}$$

Example in which Var0=2:

$$\text{seqGen}\left(\frac{u(n-1)+1}{n}, n, u, \{2, 5\}, \{3\}\right) \quad \left\{3, \frac{4}{3}, \frac{7}{12}, \frac{19}{60}\right\}$$

System of two sequences:

$$\text{seqGen}\left(\left\{\frac{1}{n}, \frac{u_2(n-1)}{2} + u_1(n-1)\right\}, n, \{u_1, u_2\}, \{1, 5\}, \left[\begin{array}{c} - \\ 2 \end{array}\right]\right) \quad \left[\begin{array}{ccccc} 1 & \frac{1}{2} & \frac{1}{3} & \frac{1}{4} & \frac{1}{5} \\ 2 & 2 & \frac{3}{2} & \frac{13}{12} & \frac{19}{24} \end{array}\right]$$

Note: The Void () in the initial term matrix above is used to indicate that the initial term for $u_1(n)$ is calculated using the explicit sequence formula $u_1(n)=1/n$.

seqn()

Catalog >

seqn($\text{Expr}(u, n$ [, ListOfInitTerms [, $n\text{Max}$ [, CeilingValue]]) $\Rightarrow$ *list*

Generates a list of terms for a sequence $u(n)=\text{Expr}(u, n)$ as follows: Increments n from 1 through $n\text{Max}$ by 1, evaluates $u(n)$ for corresponding values of n using the $\text{Expr}(u, n)$ formula and ListOfInitTerms , and returns the results as a list.

seqn($\text{Expr}(n$ [, $n\text{Max}$ [, CeilingValue]]) $\Rightarrow$ *list*

Generates a list of terms for a non-recursive sequence $u(n)=\text{Expr}(n)$ as follows: Increments n from 1 through $n\text{Max}$ by 1, evaluates $u(n)$ for corresponding values of n using the $\text{Expr}(n)$ formula, and returns the results as a list.

If $n\text{Max}$ is missing, $n\text{Max}$ is set to 2500

If $n\text{Max}=0$, $n\text{Max}$ is set to 2500

Note: **seqn()** calls **seqGen()** with $n0=1$ and $nstep=1$

Generate the first 6 terms of the sequence $u(n) = u(n-1)/2$, with $u(1)=2$.

$$\text{seqn}\left(\frac{u(n-1)}{n}, \{2\}, 6\right)$$

$$\left\{2, 1, \frac{1}{3}, \frac{1}{12}, \frac{1}{60}, \frac{1}{360}\right\}$$

$$\text{seqn}\left(\frac{1}{n^2}, 6\right)$$

$$\left\{1, \frac{1}{4}, \frac{1}{9}, \frac{1}{16}, \frac{1}{25}, \frac{1}{36}\right\}$$

setMode()

Catalog >

setMode(*modeNameInteger*, *settingInteger*) $\Rightarrow$ *integer*

setMode(*list*) $\Rightarrow$ *integer list*

Valid only within a function or program.

setMode(*modeNameInteger*, *settingInteger*) temporarily sets mode *modeNameInteger* to the new setting *settingInteger*, and returns an integer corresponding to the original setting of that mode. The change is limited to the duration of the program/function's execution.

modeNameInteger specifies which mode you want to set. It must be one of the mode integers from the table below.

settingInteger specifies the new setting for the mode. It must be one of the setting integers listed below for the specific mode you are setting.

setMode(*list*) lets you change multiple settings. *list* contains pairs of mode integers and setting integers. **setMode**(*list*) returns a similar list whose integer pairs represent the original modes and settings.

If you have saved all mode settings with **getMode(0)** $\rightarrow$ *var*, you can use **setMode**(*var*) to restore those settings until the function or program exits. See **getMode()**, page 42.

Note: The current mode settings are passed to called subroutines. If any subroutine changes a mode setting, the mode change will be lost when control returns to the calling routine.

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing instead of at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

Display approximate value of π using the default setting for Display Digits, and then display π with a setting of Fix2. Check to see that the default is restored after the program executes.

```
Define prog1()=Prgm
    Disp π
    setMode(1,16)
    Disp π
    EndPrgm
Done
```

```
prog1()
```

3.14159

shift()

Catalog >

shift(Integer1[,#ofShifts]) $\Rightarrow$ integer

Shifts the bits in a binary integer. You can enter *Integer1* in any number base; it is converted automatically to a signed, 64-bit binary form. If the magnitude of *Integer1* is too large for this form, a symmetric modulo operation brings it within the range. For more information, see ►**Base2**, page 12.

If *#ofShifts* is positive, the shift is to the left. If *#ofShifts* is negative, the shift is to the right. The default is -1 (shift right one bit).

In a right shift, the rightmost bit is dropped and 0 or 1 is inserted to match the leftmost bit. In a left shift, the leftmost bit is dropped and 0 is inserted as the rightmost bit.

For example, in a right shift:

Each bit shifts right.

0b00000000000000111101011000011010

Inserts 0 if leftmost bit is 0,
or 1 if leftmost bit is 1.

produces:

0b00000000000000111101011000011010

The result is displayed according to the Base mode. Leading zeros are not shown.

shift(List1 [,#ofShifts]) $\Rightarrow$ list

Returns a copy of *List1* shifted right or left by *#ofShifts* elements. Does not alter *List1*.

If *#ofShifts* is positive, the shift is to the left. If *#ofShifts* is negative, the shift is to the right. The default is -1 (shift right one element).

Elements introduced at the beginning or end of *list* by the shift are set to the symbol "undef".

shift(String1 [,#ofShifts]) $\Rightarrow$ string

Returns a copy of *String1* shifted right or left by *#ofShifts* characters. Does not alter *String1*.

If *#ofShifts* is positive, the shift is to the left. If *#ofShifts* is negative, the shift is to the right. The default is -1 (shift right one character).

Characters introduced at the beginning or end of *string* by the shift are set to a space.

In Bin base mode:

shift(0b1111010110000110101)	0b111101011000011010
shift(256,1)	0b1000000000

In Hex base mode:

shift(0h78E)	0h3C7
shift(0h78E,-2)	0h1E3
shift(0h78E,2)	0h1E38

Important: To enter a binary or hexadecimal number, always use the 0b or 0h prefix (zero, not the letter O).

In Dec base mode:

shift({1,2,3,4})	{undef,1,2,3}
shift({1,2,3,4},-2)	{undef,undef,1,2}
shift({1,2,3,4},2)	{3,4,undef,undef}

shift("abcd")	" abc"
shift("abcd",-2)	" ab"
shift("abcd",1)	"bcd "

sign()Catalog > **sign(Value1)** $\Rightarrow$ *value***sign(List1)** $\Rightarrow$ *list***sign(Matrix1)** $\Rightarrow$ *matrix*

For real and complex *Value1*, returns *Value1* / **abs(Value1)** when *Value1* $\neq$ 0.

Returns 1 if *Value1* is positive.

Returns -1 if *Value1* is negative.

sign(0) returns ± 1 if the complex format mode is Real; otherwise, it returns itself.

sign(0) represents the unit circle in the complex domain.

For a list or matrix, returns the signs of all the elements.

$$\begin{array}{l} \text{sign}(-3.2) \quad \quad \quad -1 \\ \text{sign}(\{2, 3, 4, -5\}) \quad \quad \quad \{1, 1, 1, -1\} \end{array}$$

If complex format mode is Real:

$$\text{sign}\left(\begin{bmatrix} -3 & 0 & 3 \end{bmatrix}\right) \quad \quad \quad \begin{bmatrix} -1 & \text{undef} & 1 \end{bmatrix}$$

simult()Catalog > **simult(coeffMatrix, constVector[, Tol])** $\Rightarrow$ *matrix*

Returns a column vector that contains the solutions to a system of linear equations.

Note: See also **linSolve()**, page 55.

coeffMatrix must be a square matrix that contains the coefficients of the equations.

constVector must have the same number of rows (same dimension) as *coeffMatrix* and contain the constants.

Optionally, any matrix element is treated as zero if its absolute value is less than *Tol*. This tolerance is used only if the matrix has floating-point entries and does not contain any symbolic variables that have not been assigned a value. Otherwise, *Tol* is ignored.

- If you set the **Auto or Approximate** mode to Approximate, computations are done using floating-point arithmetic.
- If *Tol* is omitted or not used, the default tolerance is calculated as:

$$5E-14 \cdot \max(\dim(\text{coeffMatrix})) \cdot \text{rowNorm}(\text{coeffMatrix})$$

Solve for x and y:

$$x + 2y = 1$$

$$3x + 4y = -1$$

$$\text{simult}\left(\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}, \begin{bmatrix} 1 \\ -1 \end{bmatrix}\right) \quad \quad \quad \begin{bmatrix} -3 \\ 2 \end{bmatrix}$$

The solution is $x=-3$ and $y=2$.

Solve:

$$ax + by = 1$$

$$cx + dy = 2$$

$$\begin{array}{l} \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \rightarrow \text{matx1} \quad \quad \quad \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \\ \text{simult}\left(\text{matx1}, \begin{bmatrix} 1 \\ 2 \end{bmatrix}\right) \quad \quad \quad \begin{bmatrix} 0 \\ 1 \\ 2 \end{bmatrix} \end{array}$$

simult(coeffMatrix, constMatrix[, Tol]) $\Rightarrow$ *matrix*

Solves multiple systems of linear equations, where each system has the same equation coefficients but different constants.

Each column in *constMatrix* must contain the constants for a system of equations. Each column in the resulting matrix contains the solution for the corresponding system.

Solve:

$$x + 2y = 1$$

$$3x + 4y = -1$$

$$x + 2y = 2$$

$$3x + 4y = -3$$

$$\text{simult}\left(\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}, \begin{bmatrix} 1 & 2 \\ -1 & -3 \end{bmatrix}\right) \quad \quad \quad \begin{bmatrix} -3 & -7 \\ 2 & 9 \\ 2 & 2 \end{bmatrix}$$

For the first system, $x=-3$ and $y=2$. For the second system, $x=-7$ and $y=9/2$.

sin()

sin(*Value1*) $\Rightarrow$ *value*

sin(*List1*) $\Rightarrow$ *list*

sin(*Value1*) returns the sine of the argument.

sin(*List1*) returns a list of the sines of all elements in *List1*.

Note: The argument is interpreted as a degree, gradian or radian angle, according to the current angle mode. You can use $^{\circ}$, $^{\text{G}}$, or r to override the angle mode setting temporarily.

In Degree angle mode:

$$\sin\left(\left\{\frac{\pi}{4}\right\}r\right) \quad 0.707107$$

$$\sin(45) \quad 0.707107$$

$$\sin(\{0,60,90\}) \quad \{0.,0.866025,1\}$$

In Gradian angle mode:

$$\sin(50) \quad 0.707107$$

In Radian angle mode:

$$\sin\left(\frac{\pi}{4}\right) \quad 0.707107$$

$$\sin(45^{\circ}) \quad 0.707107$$

In Radian angle mode:

$$\sin\left(\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}\right) \quad \begin{bmatrix} 0.9424 & -0.04542 & -0.031999 \\ -0.045492 & 0.949254 & -0.020274 \\ -0.048739 & -0.00523 & 0.961051 \end{bmatrix}$$

sin(*squareMatrix1*) $\Rightarrow$ *squareMatrix*

Returns the matrix sine of *squareMatrix1*. This is not the same as calculating the sine of each element. For information about the calculation method, refer to **cos()**.

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

sin⁻¹()

sin⁻¹(*Value1*) $\Rightarrow$ *value*

sin⁻¹(*List1*) $\Rightarrow$ *list*

sin⁻¹(*Value1*) returns the angle whose sine is *Value1*.

sin⁻¹(*List1*) returns a list of the inverse sines of each element of *List1*.

Note: The result is returned as a degree, gradian or radian angle, according to the current angle mode setting.

Note: You can insert this function from the keyboard by typing **arcsin**(...).

sin⁻¹(*squareMatrix1*) $\Rightarrow$ *squareMatrix*

Returns the matrix inverse sine of *squareMatrix1*. This is not the same as calculating the inverse sine of each element. For information about the calculation method, refer to **cos()**.

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

In Degree angle mode:

$$\sin^{-1}(1) \quad 90$$

In Gradian angle mode:

$$\sin^{-1}(1) \quad 100$$

In Radian angle mode:

$$\sin^{-1}(\{0,0.2,0.5\}) \quad \{0,0.201358,0.523599\}$$

In Radian angle mode and Rectangular complex format mode:

$$\sin^{-1}\left(\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}\right) \quad \begin{bmatrix} -0.164058-0.064606 \cdot i & 1.49086-2.1051 \cdot i \\ 0.725533-1.51594 \cdot i & 0.947305-0.7783 \cdot i \\ 2.08316-2.63205 \cdot i & -1.79018+1.2718 \cdot i \end{bmatrix}$$

To see the entire result, press $\blacktriangle$ and then use $\blacktriangleleft$ and $\blacktriangleright$ to move the cursor.

sinh()Catalog > **sinh**(*Numver1*) $\Rightarrow$ *value***sinh**(*List1*) $\Rightarrow$ *list***sinh** (*Value1*) returns the hyperbolic sine of the argument.**sinh** (*List1*) returns a list of the hyperbolic sines of each element of *List1*.**sinh**(*squareMatrix1*) $\Rightarrow$ *squareMatrix*Returns the matrix hyperbolic sine of *squareMatrix1*. This is not the same as calculating the hyperbolic sine of each element. For information about the calculation method, refer to **cos()**.*squareMatrix1* must be diagonalizable. The result always contains floating-point numbers.

$$\begin{array}{rcl} \sinh(1.2) & & 1.50946 \\ \sinh(\{0,1,2,3\}) & & \{0,1.50946,10.0179\} \end{array}$$

In Radian angle mode:

$$\sinh \begin{pmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{pmatrix} = \begin{bmatrix} 360.954 & 305.708 & 239.604 \\ 352.912 & 233.495 & 193.564 \\ 298.632 & 154.599 & 140.251 \end{bmatrix}$$

sinh⁻¹()Catalog > **sinh⁻¹**(*Value1*) $\Rightarrow$ *value***sinh⁻¹**(*List1*) $\Rightarrow$ *list***sinh⁻¹** (*Value1*) returns the inverse hyperbolic sine of the argument.**sinh⁻¹** (*List1*) returns a list of the inverse hyperbolic sines of each element of *List1*.**Note:** You can insert this function from the keyboard by typing **arcsinh**(...).**sinh⁻¹**(*squareMatrix1*) $\Rightarrow$ *squareMatrix*Returns the matrix inverse hyperbolic sine of *squareMatrix1*. This is not the same as calculating the inverse hyperbolic sine of each element. For information about the calculation method, refer to **cos()**.*squareMatrix1* must be diagonalizable. The result always contains floating-point numbers.

$$\begin{array}{rcl} \sinh^{-1}(0) & & 0 \\ \sinh^{-1}(\{0,2,1,3\}) & & \{0,1.48748,1.81845\} \end{array}$$

In Radian angle mode:

$$\sinh^{-1} \begin{pmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{pmatrix} = \begin{bmatrix} 0.041751 & 2.15557 & 1.1582 \\ 1.46382 & 0.926568 & 0.112557 \\ 2.75079 & -1.5283 & 0.57268 \end{bmatrix}$$

SinReg $X, Y [, [Iterations], [Period] [, Category, Include]]$

Computes the sinusoidal regression on lists X and Y . A summary of results is stored in the *stat.results* variable. (See page 98.)

All the lists must have equal dimension except for *Include*.

X and Y are lists of independent and dependent variables.

Iterations is a value that specifies the maximum number of times (1 through 16) a solution will be attempted. If omitted, 8 is used. Typically, larger values result in better accuracy but longer execution times, and vice versa.

Period specifies an estimated period. If omitted, the difference between values in X should be equal and in sequential order. If you specify *Period*, the differences between x values can be unequal.

Category is a list of numeric or string category codes for the corresponding X and Y data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

The output of **SinReg** is always in radians, regardless of the angle mode setting.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.RegEqn	Regression Equation: $a \cdot \sin(bx+c)+d$
stat.a, stat.b, stat.c, stat.d	Regression coefficients
stat.Resid	Residuals from the regression
stat.XReg	List of data points in the modified X List actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.YReg	List of data points in the modified Y List actually used in the regression based on restrictions of <i>Freq</i> , <i>Category List</i> , and <i>Include Categories</i>
stat.FreqReg	List of frequencies corresponding to <i>stat.XReg</i> and <i>stat.YReg</i>

SortA

SortA $List1[, List2] [, List3] \dots$

SortA $Vector1[, Vector2] [, Vector3] \dots$

Sorts the elements of the first argument in ascending order.

If you include additional arguments, sorts the elements of each so that their new positions match the new positions of the elements in the first argument.

All arguments must be names of lists or vectors. All arguments must have equal dimensions.

Empty (void) elements within the first argument move to the bottom. For more information on empty elements, see page 132.

$\{2,1,4,3\} \rightarrow list1$	$\{2,1,4,3\}$
SortA list1	Done
list1	$\{1,2,3,4\}$
$\{4,3,2,1\} \rightarrow list2$	$\{4,3,2,1\}$
SortA list2,list1	Done
list2	$\{1,2,3,4\}$
list1	$\{4,3,2,1\}$

SortD

Catalog > 

SortD *List1*, *List2* [, *List3*] ...

SortD *Vector1* [, *Vector2*] [, *Vector3*] ...

Identical to **SortA**, except **SortD** sorts the elements in descending order.

Empty (void) elements within the first argument move to the bottom.
For more information on empty elements, see page 132.

$\{2, 1, 4, 3\} \rightarrow list1$	$\{2, 1, 4, 3\}$
$\{1, 2, 3, 4\} \rightarrow list2$	$\{1, 2, 3, 4\}$
SortD <i>list1</i> , <i>list2</i>	Done
<i>list1</i>	$\{4, 3, 2, 1\}$
<i>list2</i>	$\{3, 4, 1, 2\}$

Sphere

Catalog > 

Vector **Sphere**

Note: You can insert this operator from the computer keyboard by typing **@Sphere**.

Displays the row or column vector in spherical form $[p \angle \theta \angle \phi]$.

Vector must be of dimension 3 and can be either a row or a column vector.

Note: **Sphere** is a display-format instruction, not a conversion function. You can use it only at the end of an entry line.

$\begin{bmatrix} 1 & 2 & 3 \end{bmatrix}$ Sphere	$\begin{bmatrix} 3.74166 & \angle 1.10715 & \angle 0.640522 \end{bmatrix}$
$\begin{pmatrix} 2 & \angle \frac{\pi}{4} & 3 \end{pmatrix}$ Sphere	$\begin{bmatrix} 3.60555 & \angle 0.785398 & \angle 0.588003 \end{bmatrix}$

sqrt()

Catalog > 

sqrt(*Value1*) $\Rightarrow$ *value*

sqrt(*List1*) $\Rightarrow$ *list*

Returns the square root of the argument.

For a list, returns the square roots of all the elements in *List1*.

Note: See also **Square root template**, page 1.

$\sqrt{4}$	2
$\sqrt{\{9, 2, 4\}}$	$\{3, 1.41421, 2\}$

stat.results

Displays results from a statistics calculation.

The results are displayed as a set of name-value pairs. The specific names shown are dependent on the most recently evaluated statistics function or command.

You can copy a name or value and paste it into other locations.

Note: Avoid defining variables that use the same names as those used for statistical analysis. In some cases, an error condition could occur. Variable names used for statistical analysis are listed in the table below.

$xlist = \{1, 2, 3, 4, 5\}$	$\{1, 2, 3, 4, 5\}$
$ylist = \{4, 8, 11, 14, 17\}$	$\{4, 8, 11, 14, 17\}$

Note: Each time the Lists & Spreadsheet application calculates statistical results, it copies the "stat." group variables to a "stat#." group, where # is a number that is incremented automatically. This lets you maintain previous results while performing multiple calculations.

stat.valuesCatalog > **stat.values**See the **stat.results** example.

Displays a matrix of the values calculated for the most recently evaluated statistics function or command.

Unlike **stat.results**, **stat.values** omits the names associated with the values.

You can copy a value and paste it into other locations.

stDevPop()Catalog > 

stDevPop(List[, freqList]) $\Rightarrow$ expression

Returns the population standard deviation of the elements in *List*.

Each *freqList* element counts the number of consecutive occurrences of the corresponding element in *List*.

Note: *List* must have at least two elements. Empty (void) elements are ignored. For more information on empty elements, see page 132.

stDevPop(Matrix1[, freqMatrix]) $\Rightarrow$ matrix

Returns a row vector of the population standard deviations of the columns in *Matrix1*.

Each *freqMatrix* element counts the number of consecutive occurrences of the corresponding element in *Matrix1*.

Note: *Matrix1* must have at least two rows. Empty (void) elements are ignored. For more information on empty elements, see page 132.

In Radian angle and auto modes:

$$\text{stDevPop}\{ \{ 1, 2, 5, -6, 3, -2 \} \} \quad 3.59398$$

$$\text{stDevPop}\{ \{ 1, 3, 2, 5, -6, 4 \}, \{ 3, 2, 5 \} \} \quad 4.11107$$

$$\text{stDevPop} \left(\begin{bmatrix} 1 & 2 & 5 \\ -3 & 0 & 1 \\ 5 & 7 & 3 \end{bmatrix} \right) \quad [3.26599 \quad 2.94392 \quad 1.63299]$$

$$\text{stDevPop} \left(\begin{bmatrix} -1.2 & 5.3 \\ 2.5 & 7.3 \\ 6 & -4 \end{bmatrix}, \begin{bmatrix} 4 & 2 \\ 3 & 3 \\ 1 & 7 \end{bmatrix} \right) \quad [2.52608 \quad 5.21506]$$

stDevSamp()Catalog > 

stDevSamp(List[, freqList]) $\Rightarrow$ expression

Returns the sample standard deviation of the elements in *List*.

Each *freqList* element counts the number of consecutive occurrences of the corresponding element in *List*.

Note: *List* must have at least two elements. Empty (void) elements are ignored. For more information on empty elements, see page 132.

stDevSamp(Matrix1[, freqMatrix]) $\Rightarrow$ matrix

Returns a row vector of the sample standard deviations of the columns in *Matrix1*.

Each *freqMatrix* element counts the number of consecutive occurrences of the corresponding element in *Matrix1*.

Note: *Matrix1* must have at least two rows. Empty (void) elements are ignored. For more information on empty elements, see page 132.

$$\text{stDevSamp}\{ \{ 1, 2, 5, -6, 3, -2 \} \} \quad 3.937$$

$$\text{stDevSamp}\{ \{ 1, 3, 2, 5, -6, 4 \}, \{ 3, 2, 5 \} \} \quad 4.33345$$

$$\text{stDevSamp} \left(\begin{bmatrix} 1 & 2 & 5 \\ -3 & 0 & 1 \\ 5 & 7 & 3 \end{bmatrix} \right) \quad [3.26599 \quad 2.94392 \quad 1.63299]$$

$$\text{stDevSamp} \left(\begin{bmatrix} -1.2 & 5.3 \\ 2.5 & 7.3 \\ 6 & -4 \end{bmatrix}, \begin{bmatrix} 4 & 2 \\ 3 & 3 \\ 1 & 7 \end{bmatrix} \right) \quad [2.52608 \quad 5.21506]$$

Stop	Catalog > 
Stop Programming command: Terminates the program. Stop is not allowed in functions. Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing  instead of enter at the end of each line. On the computer keyboard, hold down Alt and press Enter .	$i:=0$ 0 Define $prog1()$ =Prgm Done For $i,1,10,1$ If $i=5$ Stop EndFor EndPrgm $prog1()$ Done i 5

-------------	----------------------------

sum()	Catalog > 
sum (List[, Start[, End]]) $\Rightarrow$ expression Returns the sum of all elements in List. Start and End are optional. They specify a range of elements. Any void argument produces a void result. Empty (void) elements in List are ignored. For more information on empty elements, see page 132.	$sum(\{1,2,3,4,5\})$ 15 $sum(\{a,2 \cdot a,3 \cdot a\})$ "Error: Variable is not defined" $sum(seq(n,n,1,10))$ 55 $sum(\{1,3,5,7,9\},3)$ 21

sum()Catalog > **sum**(*Matrix1* [, *Start* [, *End*]]) $\Rightarrow$ *matrix*Returns a row vector containing the sums of all elements in the columns in *Matrix1*.*Start* and *End* are optional. They specify a range of rows.Any void argument produces a void result. Empty (void) elements in *Matrix1* are ignored. For more information on empty elements, see page 132.

sum	$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$	$\begin{bmatrix} 5 & 7 & 9 \end{bmatrix}$
sum	$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}$	$\begin{bmatrix} 12 & 15 & 18 \end{bmatrix}$
sum	$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}, 2, 3$	$\begin{bmatrix} 11 & 13 & 15 \end{bmatrix}$

sumIf()Catalog > **sumIf**(*List*, *Criteria* [, *SumList*]) $\Rightarrow$ *value*Returns the accumulated sum of all elements in *List* that meet the specified *Criteria*. Optionally, you can specify an alternate list, *sumList*, to supply the elements to accumulate.*List* can be an expression, list, or matrix. *SumList*, if specified, must have the same dimension(s) as *List*.*Criteria* can be:

- A value, expression, or string. For example, **34** accumulates only those elements in *List* that simplify to the value 34.
- A Boolean expression containing the symbol **?** as a placeholder for each element. For example, **?<10** accumulates only those elements in *List* that are less than 10.

When a *List* element meets the *Criteria*, the element is added to the accumulating sum. If you include *sumList*, the corresponding element from *sumList* is added to the sum instead.Within the Lists & Spreadsheet application, you can use a range of cells in place of *List* and *sumList*.

Empty (void) elements are ignored. For more information on empty elements, see page 132.

Note: See also **countIf()**, page 23.

sumIf	$\{\{1, 2, e, 3, \pi, 4, 5, 6\}, 2.5 < ? < 4.5\}$	12.859874482
sumIf	$\{\{1, 2, 3, 4\}, 2 < ? < 5, \{10, 20, 30, 40\}\}$	70

sumSeq()See $\Sigma()$, page 126.**system()**Catalog > **system**(*Value1* [, *Value2* [, *Value3* [, ...]]])

Returns a system of equations, formatted as a list. You can also create a system by using a template.

T**T (transpose)**Catalog > *Matrix1*^T $\Rightarrow$ *matrix*Returns the complex conjugate transpose of *Matrix1*.**Note:** You can insert this operator from the computer keyboard by typing @t.

$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}^T$	$\begin{bmatrix} 1 & 4 & 7 \\ 2 & 5 & 8 \\ 3 & 6 & 9 \end{bmatrix}$
---	---

tan()

tan(*Value1*) $\Rightarrow$ *value*

tan(*List1*) $\Rightarrow$ *list*

tan(*Value1*) returns the tangent of the argument.

tan(*List1*) returns a list of the tangents of all elements in *List1*.

Note: The argument is interpreted as a degree, gradian or radian angle, according to the current angle mode. You can use $^{\circ}$, $^{\circ}$ or $^{\circ}$ to override the angle mode setting temporarily.

In Degree angle mode:

$$\tan\left(\left(\frac{\pi}{4}\right)^{\circ}\right) = 1.$$

$$\tan(45) = 1.$$

$$\tan(\{0, 60, 90\}) = \{0., 1.73205, \text{undef}\}$$

In Gradian angle mode:

$$\tan\left(\left(\frac{\pi}{4}\right)^{\circ}\right) = 1.$$

$$\tan(50) = 1.$$

$$\tan(\{0, 50, 100\}) = \{0., 1., \text{undef}\}$$

In Radian angle mode:

$$\tan\left(\frac{\pi}{4}\right) = 1.$$

$$\tan(45^{\circ}) = 1.$$

$$\tan\left(\left\{\pi, \frac{\pi}{3}, -\pi, \frac{\pi}{4}\right\}\right) = \{0., 1.73205, 0., 1.\}$$

tan(*squareMatrix1*) $\Rightarrow$ *squareMatrix*

Returns the matrix tangent of *squareMatrix1*. This is not the same as calculating the tangent of each element. For information about the calculation method, refer to **cos()**.

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

In Radian angle mode:

$$\tan\left(\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}\right) = \begin{bmatrix} -28.2912 & 26.0887 & 11.1142 \\ 12.1171 & -7.83536 & -5.48138 \\ 36.8181 & -32.8063 & -10.4594 \end{bmatrix}$$

tan⁻¹()

tan⁻¹(*Value1*) $\Rightarrow$ *value*

tan⁻¹(*List1*) $\Rightarrow$ *list*

tan⁻¹(*Value1*) returns the angle whose tangent is *Value1*.

tan⁻¹(*List1*) returns a list of the inverse tangents of each element of *List1*.

Note: The result is returned as a degree, gradian or radian angle, according to the current angle mode setting.

Note: You can insert this function from the keyboard by typing **arctan**(...).

In Degree angle mode:

$$\tan^{-1}(1) = 45$$

In Gradian angle mode:

$$\tan^{-1}(1) = 50$$

In Radian angle mode:

$$\tan^{-1}(\{0, 0.2, 0.5\}) = \{0, 0.197396, 0.463648\}$$

tan⁻¹() **key****tan⁻¹(squareMatrix1)** ⇒ *squareMatrix*

Returns the matrix inverse tangent of *squareMatrix1*. This is not the same as calculating the inverse tangent of each element. For information about the calculation method, refer to **cos()**.

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

In Radian angle mode:

$$\tan^{-1} \begin{pmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{pmatrix} = \begin{bmatrix} -0.083658 & 1.26629 & 0.62263 \\ 0.748539 & 0.630015 & -0.070012 \\ 1.68608 & -1.18244 & 0.455126 \end{bmatrix}$$

tanh()**Catalog >** **tanh(Value1)** ⇒ *value***tanh(List1)** ⇒ *list***tanh(Value1)** returns the hyperbolic tangent of the argument.**tanh(List1)** returns a list of the hyperbolic tangents of each element of *List1*.**tanh(squareMatrix1)** ⇒ *squareMatrix*

Returns the matrix hyperbolic tangent of *squareMatrix1*. This is not the same as calculating the hyperbolic tangent of each element. For information about the calculation method, refer to **cos()**.

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

In Radian angle mode:

$$\tanh \begin{pmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{pmatrix} = \begin{bmatrix} -0.097966 & 0.933436 & 0.425972 \\ 0.488147 & 0.538881 & -0.129382 \\ 1.28295 & -1.03425 & 0.428817 \end{bmatrix}$$

tanh⁻¹()**Catalog >** **tanh⁻¹(Value1)** ⇒ *value***tanh⁻¹(List1)** ⇒ *list***tanh⁻¹(Value1)** returns the inverse hyperbolic tangent of the argument.**tanh⁻¹(List1)** returns a list of the inverse hyperbolic tangents of each element of *List1*.

Note: You can insert this function from the keyboard by typing **arctanh(...)**.

tanh⁻¹(squareMatrix1) ⇒ *squareMatrix*

Returns the matrix inverse hyperbolic tangent of *squareMatrix1*. This is not the same as calculating the inverse hyperbolic tangent of each element. For information about the calculation method, refer to **cos()**.

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

In Rectangular complex format:

$$\begin{aligned} \tanh^{-1}(0) &= 0. \\ \tanh^{-1}(\{1, 2, 1, 3\}) &= \{ \text{undef}, 0.518046 - 1.5708 \cdot i, 0.346574 - 1.5708 \cdot i, \text{undef} \} \end{aligned}$$

To see the entire result, press and then use and to move the cursor.

In Radian angle mode and Rectangular complex format:

$$\begin{aligned} \tanh^{-1} \begin{pmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{pmatrix} &= \begin{bmatrix} -0.099353 + 0.164058 \cdot i & 0.267834 - 1.4908 \cdot i & -0.087596 - 0.725533 \cdot i \\ 0.511463 - 2.08316 \cdot i & -0.878563 + 1.7901 \cdot i & \text{undef} \end{bmatrix} \end{aligned}$$

To see the entire result, press and then use and to move the cursor.

tCdf()

Catalog > 

tCdf(lowBound,upBound,df) $\Rightarrow$ number if lowBound and upBound are numbers, list if lowBound and upBound are lists

Computes the Student-*t* distribution probability between lowBound and upBound for the specified degrees of freedom df.

For $P(X \leq \text{upBound})$, set lowBound = -9E999.

Text

Catalog > 

Text promptString[, DispFlag]

Programming command: Pauses the program and displays the character string promptString in a dialog box.

When the user selects **OK**, program execution continues.

The optional flag argument can be any expression.

- If DispFlag is omitted or evaluates to **1**, the text message is added to the Calculator history.
- If DispFlag evaluates to **0**, the text message is not added to the history.

If the program needs a typed response from the user, refer to **Request**, page 84, or **RequestStr**, page 85.

Note: You can use this command within a user-defined program but not within a function.

Define a program that pauses to display each of five random numbers in a dialog box.

Within the Prgm...EndPrgm template, complete each line by pressing  instead of **enter**. On the computer keyboard, hold down **Alt** and press **Enter**.

Define text_demo()=Prgm

```
For i,1,5
  strinfo:="Random number " & string(rand(i))
  Text strinfo
EndFor
EndPrgm
```

Run the program:

text_demo()

Sample of one dialog box:

Then

See **If**, page 45.

tInterval

Catalog > 

tInterval List[,Freq[,CLevel]]

(Data list input)

tInterval $\bar{x}$,sx,n[,CLevel]

(Summary stats input)

Computes a *t* confidence interval. A summary of results is stored in the stat.results variable. (See page 98.)

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.CLower, stat.CUpper	Confidence interval for an unknown population mean
stat. $\bar{x}$	Sample mean of the data sequence from the normal random distribution
stat.ME	Margin of error
stat.df	Degrees of freedom
stat. σ_x	Sample standard deviation

Output variable	Description
stat.n	Length of the data sequence with sample mean

Interval_2Samp

Catalog > 

Interval_2Samp

List1, List2[, Freq1[, Freq2[, CLevel[, Pooled]]]]

(Data list input)

Interval_2Samp $\bar{X}1, sx1, n1, \bar{X}2, sx2, n2[, CLevel[, Pooled]]$

(Summary stats input)

Computes a two-sample *t* confidence interval. A summary of results is stored in the *stat.results* variable. (See page 98.)

Pooled=1 pools variances; *Pooled*=0 does not pool variances.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.CLower, stat.CUpper	Confidence interval containing confidence level probability of distribution
stat. $\bar{X}1$ - $\bar{X}2$	Sample means of the data sequences from the normal random distribution
stat.ME	Margin of error
stat.df	Degrees of freedom
stat. $\bar{X}1$, stat. $\bar{X}2$	Sample means of the data sequences from the normal random distribution
stat. $\sigma x1$, stat. $\sigma x2$	Sample standard deviations for List 1 and List 2
stat.n1, stat.n2	Number of samples in data sequences
stat.sp	The pooled standard deviation. Calculated when <i>Pooled</i> = YES

tPdf()

Catalog > 

tPdf(*XVal*, *df*) $\Rightarrow$ number if *XVal* is a number, list if *XVal* is a list

Computes the probability density function (pdf) for the Student-*t* distribution at a specified *x* value with specified degrees of freedom *df*.

trace()

Catalog > 

trace(squareMatrix) $\Rightarrow$ value

Returns the trace (sum of all the elements on the main diagonal) of squareMatrix.

trace	$\begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{pmatrix}$	15
a:=12		12
trace	$\begin{pmatrix} a & 0 \\ 1 & a \end{pmatrix}$	24

Try*block1***Else***block2***EndTry**

Executes *block1* unless an error occurs. Program execution transfers to *block2* if an error occurs in *block1*. System variable *errCode* contains the error code to allow the program to perform error recovery. For a list of error codes, see "Error codes and messages," page 138.

block1 and *block2* can be either a single statement or a series of statements separated with the ";" character.

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing  instead of  at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

Define *prog1()*=Prgm

Try

z::=*z*+1

Disp "z incremented."

Else

Disp "Sorry, z undefined."

EndTry

EndPrgm

Done

z::=1:*prog1()*

z incremented.

Done

DelVar *z*:*prog1()*

Sorry, z undefined.

Done

Example 2

To see the commands **Try**, **ClrErr**, and **PassErr** in operation, enter the *eigenvals()* program shown at the right. Run the program by executing each of the following expressions.

$$\text{eigenvals}\left(\begin{bmatrix} -3 \\ -41 \\ 5 \end{bmatrix}, \begin{bmatrix} -1 & 2 & -3.1 \end{bmatrix}\right)$$

Note: See also **ClrErr**, page 17, and **PassErr**, page 74.

Define *eigenvals(a,b)*=Prgm© Program *eigenvals(A,B)* displays eigenvalues of A-B

Try

Disp "A= ",a

Disp "B= ",b

Disp " "

Disp "Eigenvalues of A-B are:",eigVl(a*b)

Else

If *errCode*=230 Then

Disp "Error: Product of A-B must be a square matrix"

ClrErr

Else

PassErr

EndIf

EndTry

EndPrgm

tTest

tTest μ_0 ,List[,Freq[,Hypoth]]

(Data list input)

tTest μ_0 , $\bar{x}$,s_x,n_t[,Hypoth]

(Summary stats input)

Performs a hypothesis test for a single unknown population mean μ when the population standard deviation σ is unknown. A summary of results is stored in the *stat.results* variable. (See page 98.)

Test H_0 : $\mu = \mu_0$, against one of the following:

For H_a : $\mu < \mu_0$, set *Hypoth*<0For H_a : $\mu \neq \mu_0$ (default), set *Hypoth*=0For H_a : $\mu > \mu_0$, set *Hypoth*>0

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.t	$(\bar{x} - \mu_0) / (\text{stdev} / \sqrt{n})$
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.df	Degrees of freedom
stat. $\bar{x}$	Sample mean of the data sequence in <i>List</i>
stat.sx	Sample standard deviation of the data sequence
stat.n	Size of the sample

tTest_2Samp

Catalog > 

tTest_2Samp *List1, List2[, Freq1[, Freq2[, Hypoth[, Pooled]]]]*

(Data list input)

tTest_2Samp $\bar{x}1, sx1, n1, \bar{x}2, sx2, n2[, Hypoth[, Pooled]]$

(Summary stats input)

Computes a two-sample *t* test. A summary of results is stored in the *stat.results* variable. (See page 98.)

Test $H_0: \mu_1 = \mu_2$, against one of the following:

For $H_a: \mu_1 < \mu_2$, set *Hypoth* < 0

For $H_a: \mu_1 \neq \mu_2$ (default), set *Hypoth* = 0

For $H_a: \mu_1 > \mu_2$, set *Hypoth* > 0

Pooled = 1 pools variances

Pooled = 0 does not pool variances

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.t	Standard normal value computed for the difference of means
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat.df	Degrees of freedom for the t-statistic
stat. $\bar{x}1$, stat. $\bar{x}2$	Sample means of the data sequences in <i>List 1</i> and <i>List 2</i>
stat.sx1, stat.sx2	Sample standard deviations of the data sequences in <i>List 1</i> and <i>List 2</i>
stat.n1, stat.n2	Size of the samples
stat.sp	The pooled standard deviation. Calculated when <i>Pooled</i> = 1.

tvmFV()

Catalog > 

tvmFV(*N, I, PV, Pmt, [PpY], [CpY], [PmtAt]*) $\Rightarrow$ *value*

Financial function that calculates the future value of money.

$\text{tvmFV}(120, 5, 0, -500, 12, 12)$ 77641.1

Note: Arguments used in the TVM functions are described in the table of TVM arguments, page 108. See also **amortTbl()**, page 6.

tvml() Catalog >

tvml($N, PV, Pmt, FV, [PpY], [CpY], [PmtAt]$) $\Rightarrow$ value

Financial function that calculates the interest rate per year.

Note: Arguments used in the TVM functions are described in the table of TVM arguments, page 108. See also **amortTbl()**, page 6.

$\text{tvml}(240, 100000, -1000, 0, 12, 12)$ 10.5241

tvmN() Catalog >

tvmN($I, PV, Pmt, FV, [PpY], [CpY], [PmtAt]$) $\Rightarrow$ value

Financial function that calculates the number of payment periods.

Note: Arguments used in the TVM functions are described in the table of TVM arguments, page 108. See also **amortTbl()**, page 6.

$\text{tvmN}(5, 0, -500, 77641, 12, 12)$ 120.

tvmPmt() Catalog >

tvmPmt($N, I, PV, FV, [PpY], [CpY], [PmtAt]$) $\Rightarrow$ value

Financial function that calculates the amount of each payment.

Note: Arguments used in the TVM functions are described in the table of TVM arguments, page 108. See also **amortTbl()**, page 6.

$\text{tvmPmt}(60, 4, 30000, 0, 12, 12)$ -552.496

tvmPV() Catalog >

tvmPV($N, I, Pmt, FV, [PpY], [CpY], [PmtAt]$) $\Rightarrow$ value

Financial function that calculates the present value.

Note: Arguments used in the TVM functions are described in the table of TVM arguments, page 108. See also **amortTbl()**, page 6.

$\text{tvmPV}(48, 4, -500, 30000, 12, 12)$ -3426.7

TVM argument*	Description	Data type
N	Number of payment periods	real number
I	Annual interest rate	real number
PV	Present value	real number
Pmt	Payment amount	real number
FV	Future value	real number
PpY	Payments per year, default=1	integer > 0
CpY	Compounding periods per year, default=1	integer > 0
$PmtAt$	Payment due at the end or beginning of each period, default=end	integer (0=end, 1=beginning)

* These time-value-of-money argument names are similar to the TVM variable names (such as **tvm.pv** and **tvm.pmt**) that are used by the Calculator application's finance solver. Financial functions, however, do not store their argument values or results to the TVM variables.

TwoVar *X*, *Y* [, *Freq*] [, *Category*, *Include*]

Calculates the TwoVar statistics. A summary of results is stored in the *stat.results* variable. (See page 98.)

All the lists must have equal dimension except for *Include*.

X and *Y* are lists of independent and dependent variables.

Freq is an optional list of frequency values. Each element in *Freq* specifies the frequency of occurrence for each corresponding *X* and *Y* data point. The default value is 1. All elements must be integers ≥ 0 .

Category is a list of numeric category codes for the corresponding *X* and *Y* data.

Include is a list of one or more of the category codes. Only those data items whose category code is included in this list are included in the calculation.

An empty (void) element in any of the lists *X*, *Freq*, or *Category* results in a void for the corresponding element of all those lists. An empty element in any of the lists *X1* through *X20* results in a void for the corresponding element of all those lists. For more information on empty elements, see page 132.

Output variable	Description
stat. $\bar{X}$	Mean of x values
stat. Σx	Sum of x values
stat. Σx^2	Sum of x ² values
stat.sx	Sample standard deviation of x
stat. σx	Population standard deviation of x
stat.n	Number of data points
stat. $\bar{y}$	Mean of y values
stat. Σy	Sum of y values
stat. Σy^2	Sum of y ² values
stat.sy	Sample standard deviation of y
stat. σy	Population standard deviation of y
stat. Σxy	Sum of x • y values
stat.r	Correlation coefficient
stat.MinX	Minimum of x values
stat.Q ₁ X	1st Quartile of x
stat.MedianX	Median of x
stat.Q ₃ X	3rd Quartile of x
stat.MaxX	Maximum of x values
stat.MinY	Minimum of y values
stat.Q ₁ Y	1st Quartile of y

Output variable	Description
stat.MedY	Median of y
stat.Q3Y	3rd Quartile of y
stat.MaxY	Maximum of y values
stat. $\Sigma(x-\bar{x})^2$	Sum of squares of deviations from the mean of x
stat. $\Sigma(y-\bar{y})^2$	Sum of squares of deviations from the mean of y

U

unitV()	Catalog > 
unitV (<i>Vector1</i>) $\Rightarrow$ <i>vector</i> Returns either a row- or column-unit vector, depending on the form of <i>Vector1</i> . <i>Vector1</i> must be either a single-row matrix or a single-column matrix.	$\text{unitV}\left(\begin{bmatrix} 1 & 2 & 1 \end{bmatrix}\right) = \begin{bmatrix} 0.408248 & 0.816497 & 0.408248 \end{bmatrix}$ $\text{unitV}\left(\begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}\right) = \begin{bmatrix} 0.267261 \\ 0.534522 \\ 0.801784 \end{bmatrix}$

unLock	Catalog > 
unLock <i>Var1</i> [, <i>Var2</i>] [, <i>Var3</i>] ... unLock <i>Var</i> . Unlocks the specified variables or variable group. Locked variables cannot be modified or deleted. See Lock , page 57, and getLockInfo() , page 42.	$a:=65$ 65 Lock <i>a</i> Done getLockInfo(<i>a</i>) 1 $a:=75$ "Error: Variable is locked." DelVar <i>a</i> "Error: Variable is locked." V

varPop()	Catalog > 
varPop (<i>List</i> [, <i>freqList</i>]) $\Rightarrow$ <i>expression</i> Returns the population variance of <i>List</i> . Each <i>freqList</i> element counts the number of consecutive occurrences of the corresponding element in <i>List</i> . Note: <i>List</i> must contain at least two elements. If an element in either list is empty (void), that element is ignored, and the corresponding element in the other list is also ignored. For more information on empty elements, see page 132.	$\text{varPop}\{\{5,10,15,20,25,30\}\}$ 72.9167

varSamp()

Catalog >

varSamp(*List* [, *freqList*]) $\Rightarrow$ *expression*Returns the sample variance of *List*.Each *freqList* element counts the number of consecutive occurrences of the corresponding element in *List*.**Note:** *List* must contain at least two elements.

If an element in either list is empty (void), that element is ignored, and the corresponding element in the other list is also ignored. For more information on empty elements, see page 132.

varSamp(*Matrix1* [, *freqMatrix*]) $\Rightarrow$ *matrix*Returns a row vector containing the sample variance of each column in *Matrix1*.Each *freqMatrix* element counts the number of consecutive occurrences of the corresponding element in *Matrix1*.

If an element in either matrix is empty (void), that element is ignored, and the corresponding element in the other matrix is also ignored. For more information on empty elements, see page 132.

Note: *Matrix1* must contain at least two rows.

$$\text{varSamp}\left(\left\{1,2,5,-6,3,-2\right\}\right) \quad \frac{31}{2}$$

$$\text{varSamp}\left(\left\{1,3,5\right\},\left\{4,6,2\right\}\right) \quad \frac{68}{33}$$

$$\text{varSamp}\left(\begin{bmatrix} 1 & 2 & 5 \\ -3 & 0 & 1 \\ .5 & .7 & 3 \end{bmatrix}\right) \quad \begin{bmatrix} 4.75 & 1.03 & 4 \end{bmatrix}$$

$$\text{varSamp}\left(\begin{bmatrix} -1.1 & 2.2 \\ 3.4 & 5.1 \\ -2.3 & 4.3 \end{bmatrix}, \begin{bmatrix} 6 & 3 \\ 2 & 4 \\ 5 & 1 \end{bmatrix}\right) \quad \begin{bmatrix} 3.91731 & 2.08411 \end{bmatrix}$$

W**warnCodes()**

Catalog >

warnCodes(*Expr1*, *StatusVar*) $\Rightarrow$ *expression*Evaluates expression *Expr1*, returns the result, and stores the codes of any generated warnings in the *StatusVar* list variable. If no warnings are generated, this function assigns *StatusVar* an empty list.*Expr1* can be any valid TI-Nspire™ or TI-Nspire™ CAS math expression. You cannot use a command or assignment as *Expr1*.*StatusVar* must be a valid variable name.

For a list of warning codes and associated messages, see page 144.

$$\text{warnCodes}\left(\text{solve}\left(\sin\left(10\cdot x\right)=\frac{x^2}{x},x\right),\text{warn}\right)$$

$$x=-0.84232 \text{ or } x=-0.706817 \text{ or } x=-0.285234 \text{ or } x=0$$

$$\text{warn} \quad \{10007,10009\}$$

To see the entire result, press $\blacktriangle$ and then use $\blacktriangleleft$ and $\blacktriangleright$ to move the cursor.**when()**

Catalog >

when(*Condition*, *trueResult* [, *falseResult*] [, *unknownResult*]) $\Rightarrow$ *expression*Returns *trueResult*, *falseResult*, or *unknownResult*, depending on whether *Condition* is true, false, or unknown. Returns the input if there are too few arguments to specify the appropriate result.Omit both *falseResult* and *unknownResult* to make an expression defined only in the region where *Condition* is true.Use an **undef** *falseResult* to define an expression that graphs only on an interval.**when()** is helpful for defining recursive functions.

$$\text{when}(x<0,x+3)|x=5 \quad \text{undef}$$

$$\text{when}(n>0,n\cdot\text{factorial}(n-1),1)\rightarrow\text{factorial}(n)$$

$$\text{factorial}(3) \quad \text{Done}$$

$$3! \quad 6$$

While

Catalog > 

While Condition

Block

EndWhile

Executes the statements in *Block* as long as *Condition* is true.

Block can be either a single statement or a sequence of statements separated with the ":" character.

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing  instead of  at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

```
Define sum_of_recip(n)=Func

X

xor

Catalog > 

BooleanExpr1 **xor** *BooleanExpr2* returns *Boolean expression*
BooleanList1 **xor** *BooleanList2* returns *Boolean list*
BooleanMatrix1 **xor** *BooleanMatrix2* returns *Boolean matrix*

Returns true if *BooleanExpr1* is true and *BooleanExpr2* is false, or vice versa.

Returns false if both arguments are true or if both are false. Returns a simplified Boolean expression if either of the arguments cannot be resolved to true or false.

Note: See **or**, page 73.

Integer1 **xor** *Integer2* ⇒ *integer*

Compares two real integers bit-by-bit using an **xor** operation. Internally, both integers are converted to signed, 64-bit binary numbers. When corresponding bits are compared, the result is 1 if either bit (but not both) is 1; the result is 0 if both bits are 0 or both bits are 1. The returned value represents the bit results, and is displayed according to the Base mode.

You can enter the integers in any number base. For a binary or hexadecimal entry, you must use the 0b or 0h prefix, respectively. Without a prefix, integers are treated as decimal (base 10).

If you enter a decimal integer that is too large for a signed, 64-bit binary form, a symmetric modulo operation is used to bring the value into the appropriate range. For more information, see **Base2**, page 12.

Note: See **or**, page 73.

In Hex base mode:

Important: Zero, not the letter O.

0h7AC36 xor 0h3D5F	0h79169
--------------------	---------

In Bin base mode:

0b100101 xor 0b100	0b100001
--------------------	----------

Note: A binary entry can have up to 64 digits (not counting the 0b prefix). A hexadecimal entry can have up to 16 digits.

Z

zInterval

Catalog > 

zInterval $\sigma, List[, Freq[, CLevel]]$

(Data list input)

zInterval $\sigma, \bar{x}, n [, CLevel]$

(Summary stats input)

Computes a z confidence interval. A summary of results is stored in the *stat.results* variable. (See page 98.)

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.CLower, stat.CUpper	Confidence interval for an unknown population mean
stat. $\bar{x}$	Sample mean of the data sequence from the normal random distribution
stat.ME	Margin of error
stat.sx	Sample standard deviation
stat.n	Length of the data sequence with sample mean
stat. σ	Known population standard deviation for data sequence <i>List</i>

zInterval_1Prop

Catalog > 

zInterval_1Prop $x, n [, CLevel]$

Computes a one-proportion z confidence interval. A summary of results is stored in the *stat.results* variable. (See page 98.)

x is a non-negative integer.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.CLower, stat.CUpper	Confidence interval containing confidence level probability of distribution
stat. $\hat{p}$	The calculated proportion of successes
stat.ME	Margin of error
stat.n	Number of samples in data sequence

zInterval_2Prop $x1, n1, x2, n2[, CLevel]$

Computes a two-proportion z confidence interval. A summary of results is stored in the *stat.results* variable. (See page 98.)

$x1$ and $x2$ are non-negative integers.

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.CLower, stat.CUpper	Confidence interval containing confidence level probability of distribution
stat. $\hat{p}$ Diff	The calculated difference between proportions
stat.ME	Margin of error
stat. $\hat{p}_1$	First sample proportion estimate
stat. $\hat{p}_2$	Second sample proportion estimate
stat.n1	Sample size in data sequence one
stat.n2	Sample size in data sequence two

zInterval_2Samp $\sigma_1, \sigma_2, List1, List2[, Freq1[, Freq2[, CLevel]]]$

(Data list input)

zInterval_2Samp $\sigma_1, \sigma_2, \bar{x}_1, n1, \bar{x}_2, n2[, CLevel]$

(Summary stats input)

Computes a two-sample z confidence interval. A summary of results is stored in the *stat.results* variable. (See page 98.)

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.CLower, stat.CUpper	Confidence interval containing confidence level probability of distribution
stat. $\bar{x}_1 - \bar{x}_2$	Sample means of the data sequences from the normal random distribution
stat.ME	Margin of error
stat. $\bar{x}_1$, stat. $\bar{x}_2$	Sample means of the data sequences from the normal random distribution
stat. σx_1 , stat. σx_2	Sample standard deviations for <i>List 1</i> and <i>List 2</i>
stat.n1, stat.n2	Number of samples in data sequences
stat.r1, stat.r2	Known population standard deviations for data sequence <i>List 1</i> and <i>List 2</i>

zTestCatalog > **zTest** $\mu_0, \sigma, List, [Freq[, Hypoth]]$

(Data list input)

zTest $\mu_0, \sigma, \bar{X}, n[, Hypoth]$

(Summary stats input)

Performs a *z* test with frequency *freqlist*. A summary of results is stored in the *stat.results* variable. (See page 98.)

Test $H_0: \mu = \mu_0$, against one of the following:

For $H_a: \mu < \mu_0$, set *Hypoth*<0

For $H_a: \mu \neq \mu_0$ (default), set *Hypoth*=0

For $H_a: \mu > \mu_0$, set *Hypoth*>0

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.z	$(\bar{X} - \mu_0) / (\sigma / \sqrt{n})$
stat.P Value	Least probability at which the null hypothesis can be rejected
stat. $\bar{X}$	Sample mean of the data sequence in <i>List</i>
stat.sx	Sample standard deviation of the data sequence. Only returned for <i>Data</i> input.
stat.n	Size of the sample

zTest_1PropCatalog > **zTest_1Prop** $p_0, x, n[, Hypoth]$

Computes a one-proportion *z* test. A summary of results is stored in the *stat.results* variable. (See page 98.)

x is a non-negative integer.

Test $H_0: p = p_0$ against one of the following:

For $H_a: p > p_0$, set *Hypoth*>0

For $H_a: p \neq p_0$ (default), set *Hypoth*=0

For $H_a: p < p_0$, set *Hypoth*<0

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.p0	Hypothesized population proportion
stat.z	Standard normal value computed for the proportion
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat. $\hat{p}$	Estimated sample proportion
stat.n	Size of the sample

zTest_2Prop $x1, n1, x2, n2[, Hypoth]$

Computes a two-proportion z test. A summary of results is stored in the *stat.results* variable. (See page 98.)

$x1$ and $x2$ are non-negative integers.

Test $H_0: p1 = p2$, against one of the following:

For $H_a: p1 > p2$, set *Hypoth*>0

For $H_a: p1 \neq p2$ (default), set *Hypoth*=0

For $H_a: p < p0$, set *Hypoth*<0

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.z	Standard normal value computed for the difference of proportions
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat. $\hat{p}1$	First sample proportion estimate
stat. $\hat{p}2$	Second sample proportion estimate
stat. $\hat{p}$	Pooled sample proportion estimate
stat.n1, stat.n2	Number of samples taken in trials 1 and 2

zTest_2Samp**zTest_2Samp** $\sigma_1, \sigma_2, List1, List2[, Freq1[, Freq2[, Hypoth]]]$

(Data list input)

zTest_2Samp $\sigma_1, \sigma_2, \bar{x}1, n1, \bar{x}2, n2[, Hypoth]$

(Summary stats input)

Computes a two-sample z test. A summary of results is stored in the *stat.results* variable. (See page 98.)

Test $H_0: \mu1 = \mu2$, against one of the following:

For $H_a: \mu1 < \mu2$, set *Hypoth*<0

For $H_a: \mu1 \neq \mu2$ (default), set *Hypoth*=0

For $H_a: \mu1 > \mu2$, *Hypoth*>0

For information on the effect of empty elements in a list, see "Empty (Void) Elements" on page 132.

Output variable	Description
stat.z	Standard normal value computed for the difference of means
stat.PVal	Smallest level of significance at which the null hypothesis can be rejected
stat. $\bar{x}1$, stat. $\bar{x}2$	Sample means of the data sequences in <i>List1</i> and <i>List2</i>
stat.sx1, stat.sx2	Sample standard deviations of the data sequences in <i>List1</i> and <i>List2</i>
stat.n1, stat.n2	Size of the samples

Symbols

+ (add)

 key

$Value1 + Value2 \Rightarrow value$

Returns the sum of the two arguments.

56	56
56+4	60
60+4	64
64+4	68
68+4	72

$List1 + List2 \Rightarrow list$

$Matrix1 + Matrix2 \Rightarrow matrix$

Returns a list (or matrix) containing the sums of corresponding elements in *List1* and *List2* (or *Matrix1* and *Matrix2*).

Dimensions of the arguments must be equal.

$\left\{ 22, \pi, \frac{\pi}{2} \right\} \rightarrow I1$	$\{ 22, 3.14159, 1.5708 \}$
$\left\{ 10, 5, \frac{\pi}{2} \right\} \rightarrow I2$	$\{ 10, 5, 1.5708 \}$
$I1 + I2$	$\{ 32, 8.14159, 3.14159 \}$

$Value + List1 \Rightarrow list$

$List1 + Value \Rightarrow list$

Returns a list containing the sums of *Value* and each element in *List1*.

$Value + Matrix1 \Rightarrow matrix$

$Matrix1 + Value \Rightarrow matrix$

Returns a matrix with *Value* added to each element on the diagonal of *Matrix1*. *Matrix1* must be square.

$15 + \{ 10, 15, 20 \}$	$\{ 25, 30, 35 \}$
$\{ 10, 15, 20 \} + 15$	$\{ 25, 30, 35 \}$

$20 + \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$	$\begin{bmatrix} 21 & 2 \\ 3 & 24 \end{bmatrix}$
---	--

Note: Use $+.+$ (dot plus) to add an expression to each element.

− (subtract)

 key

$Value1 - Value2 \Rightarrow value$

Returns *Value1* minus *Value2*.

6−2	4
$\pi - \frac{\pi}{6}$	2.61799

$List1 - List2 \Rightarrow list$

$Matrix1 - Matrix2 \Rightarrow matrix$

Subtracts each element in *List2* (or *Matrix2*) from the corresponding element in *List1* (or *Matrix1*), and returns the results.

Dimensions of the arguments must be equal.

$\left\{ 22, \pi, \frac{\pi}{2} \right\} - \left\{ 10, 5, \frac{\pi}{2} \right\}$	$\{ 12, -1.85841, 0 \}$
$\begin{bmatrix} 3 & 4 \end{bmatrix} - \begin{bmatrix} 1 & 2 \end{bmatrix}$	$\begin{bmatrix} 2 & 2 \end{bmatrix}$

$Value - List1 \Rightarrow list$

$List1 - Value \Rightarrow list$

Subtracts each *List1* element from *Value* or subtracts *Value* from each *List1* element, and returns a list of the results.

$15 - \{ 10, 15, 20 \}$	$\{ 5, 0, -5 \}$
$\{ 10, 15, 20 \} - 15$	$\{ -5, 0, 5 \}$

-(subtract)	[-] key
$Value - Matrix1 \Rightarrow matrix$	$20 - \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \Rightarrow \begin{bmatrix} 19 & -2 \\ -3 & 16 \end{bmatrix}$
$Matrix1 - Value \Rightarrow matrix$	
$Value - Matrix1$ returns a matrix of $Value$ times the identity matrix minus $Matrix1$. $Matrix1$ must be square.	
$Matrix1 - Value$ returns a matrix of $Value$ times the identity matrix subtracted from $Matrix1$. $Matrix1$ must be square.	
Note: Use $-$ (dot minus) to subtract an expression from each element.	

· (multiply)	[x] key
$Value1 \cdot Value2 \Rightarrow value$	$2 \cdot 3.45 \Rightarrow 6.9$
Returns the product of the two arguments.	
$List1 \cdot List2 \Rightarrow list$	$\{1., 2, 3\} \cdot \{4, 5, 6\} \Rightarrow \{4, 10, 18\}$
Returns a list containing the products of the corresponding elements in $List1$ and $List2$.	
Dimensions of the lists must be equal.	
$Matrix1 \cdot Matrix2 \Rightarrow matrix$	$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix} \cdot \begin{bmatrix} 7 & 8 \\ 7 & 8 \\ 7 & 8 \end{bmatrix} \Rightarrow \begin{bmatrix} 42 & 48 \\ 105 & 120 \end{bmatrix}$
Returns the matrix product of $Matrix1$ and $Matrix2$.	
The number of columns in $Matrix1$ must equal the number of rows in $Matrix2$.	
$Value \cdot List1 \Rightarrow list$	$\pi \cdot \{4, 5, 6\} \Rightarrow \{12.5664, 15.708, 18.8496\}$
$List1 \cdot Value \Rightarrow list$	
Returns a list containing the products of $Value$ and each element in $List1$.	
$Value \cdot Matrix1 \Rightarrow matrix$	$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \cdot 0.01 \Rightarrow \begin{bmatrix} 0.01 & 0.02 \\ 0.03 & 0.04 \end{bmatrix}$
$Matrix1 \cdot Value \Rightarrow matrix$	
Returns a matrix containing the products of $Value$ and each element in $Matrix1$.	$6 \cdot \text{identity}(3) \Rightarrow \begin{bmatrix} 6 & 0 & 0 \\ 0 & 6 & 0 \\ 0 & 0 & 6 \end{bmatrix}$
Note: Use $\cdot$ (dot multiply) to multiply an expression by each element.	

/ (divide)	[÷] key
$Value1 / Value2 \Rightarrow value$	$\frac{2}{3.45} \Rightarrow .57971$
Returns the quotient of $Value1$ divided by $Value2$.	
Note: See also Fraction template , page 1.	
$List1 / List2 \Rightarrow list$	$\frac{\{1., 2, 3\}}{\{4, 5, 6\}} \Rightarrow \left\{0.25, \frac{2}{5}, \frac{1}{2}\right\}$
Returns a list containing the quotients of $List1$ divided by $List2$.	
Dimensions of the lists must be equal.	
$Value / List1 \Rightarrow list$	$\frac{6}{\{3, 6, \sqrt{6}\}} \Rightarrow \{2, 1, 2.44949\}$
$List1 / Value \Rightarrow list$	
Returns a list containing the quotients of $Value$ divided by $List1$ or $List1$ divided by $Value$.	$\frac{\{7, 9, 2\}}{7 \cdot 9 \cdot 2} \Rightarrow \left\{\frac{1}{18}, \frac{1}{14}, \frac{1}{63}\right\}$

/ (divide)

$\div$ key

$Value / Matrix1 \Rightarrow matrix$

$Matrix1 / Value \Rightarrow matrix$

$$\frac{\begin{bmatrix} 7 & 9 & 2 \end{bmatrix}}{7 \cdot 9 \cdot 2} \quad \begin{bmatrix} \frac{1}{18} & \frac{1}{14} & \frac{1}{63} \end{bmatrix}$$

Returns a matrix containing the quotients of $Matrix1 / Value$.

Note: Use $\cdot$ (dot divide) to divide an expression by each element.

^ (power)

$\wedge$ key

$Value1 \wedge Value2 \Rightarrow value$

$List1 \wedge List2 \Rightarrow list$

$$4^2 \quad 16$$

Returns the first argument raised to the power of the second argument.

$$\{2,4,6\}^{\{1,2,3\}} \quad \{2,16,216\}$$

Note: See also **Exponent template**, page 1.

For a list, returns the elements in $List1$ raised to the power of the corresponding elements in $List2$.

In the real domain, fractional powers that have reduced exponents with odd denominators use the real branch versus the principal branch for complex mode.

$Value \wedge List1 \Rightarrow list$

Returns $Value$ raised to the power of the elements in $List1$.

$$\pi^{\{1,2,-3\}} \quad \{3.14159, 9.8696, 0.032252\}$$

$List1 \wedge Value \Rightarrow list$

Returns the elements in $List1$ raised to the power of $Value$.

$$\{1,2,3,4\}^{-2} \quad \left\{1, \frac{1}{4}, \frac{1}{9}, \frac{1}{16}\right\}$$

$squareMatrix1 \wedge integer \Rightarrow matrix$

Returns $squareMatrix1$ raised to the $integer$ power.

$squareMatrix1$ must be a square matrix.

If $integer = -1$, computes the inverse matrix.

If $integer < -1$, computes the inverse matrix to an appropriate positive power.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}^2 \quad \begin{bmatrix} 7 & 10 \\ 15 & 22 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}^{-1} \quad \begin{bmatrix} -2 & 1 \\ 3 & -1 \\ 2 & 2 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}^{-2} \quad \begin{bmatrix} \frac{11}{2} & -\frac{5}{2} \\ -\frac{15}{4} & \frac{7}{4} \end{bmatrix}$$

x² (square)

x^2 key

$Value1^2 \Rightarrow value$

Returns the square of the argument.

$List1^2 \Rightarrow list$

Returns a list containing the squares of the elements in $List1$.

$squareMatrix1^2 \Rightarrow matrix$

Returns the matrix square of $squareMatrix1$. This is not the same as calculating the square of each element. Use $\wedge 2$ to calculate the square of each element.

+. (dot add)
 **keys**

$Matrix1 \dot{+} Matrix2 \Rightarrow matrix$

$Value \dot{+} Matrix1 \Rightarrow matrix$

$Matrix1 \dot{+} Matrix2$ returns a matrix that is the sum of each pair of corresponding elements in $Matrix1$ and $Matrix2$.

$Value \dot{+} Matrix1$ returns a matrix that is the sum of $Value$ and each element in $Matrix1$.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \dot{+} \begin{bmatrix} 10 & 30 \\ 20 & 40 \end{bmatrix} = \begin{bmatrix} 11 & 32 \\ 23 & 44 \end{bmatrix}$$

$$5 \dot{+} \begin{bmatrix} 10 & 30 \\ 20 & 40 \end{bmatrix} = \begin{bmatrix} 15 & 35 \\ 25 & 45 \end{bmatrix}$$

.- (dot sub.)
 **keys**

$Matrix1 \dot{-} Matrix2 \Rightarrow matrix$

$Value \dot{-} Matrix1 \Rightarrow matrix$

$Matrix1 \dot{-} Matrix2$ returns a matrix that is the difference between each pair of corresponding elements in $Matrix1$ and $Matrix2$.

$Value \dot{-} Matrix1$ returns a matrix that is the difference of $Value$ and each element in $Matrix1$.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \dot{-} \begin{bmatrix} 10 & 20 \\ 30 & 40 \end{bmatrix} = \begin{bmatrix} -9 & -18 \\ -27 & -36 \end{bmatrix}$$

$$5 \dot{-} \begin{bmatrix} 10 & 20 \\ 30 & 40 \end{bmatrix} = \begin{bmatrix} -5 & -15 \\ -25 & -35 \end{bmatrix}$$

.. (dot mult.)
 **keys**

$Matrix1 \dot{\cdot} Matrix2 \Rightarrow matrix$

$Value \dot{\cdot} Matrix1 \Rightarrow matrix$

$Matrix1 \dot{\cdot} Matrix2$ returns a matrix that is the product of each pair of corresponding elements in $Matrix1$ and $Matrix2$.

$Value \dot{\cdot} Matrix1$ returns a matrix containing the products of $Value$ and each element in $Matrix1$.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \dot{\cdot} \begin{bmatrix} 10 & 20 \\ 30 & 40 \end{bmatrix} = \begin{bmatrix} 10 & 40 \\ 90 & 160 \end{bmatrix}$$

$$5 \dot{\cdot} \begin{bmatrix} 10 & 20 \\ 30 & 40 \end{bmatrix} = \begin{bmatrix} 50 & 100 \\ 150 & 200 \end{bmatrix}$$

. / (dot divide)
 **keys**

$Matrix1 \dot{/} Matrix2 \Rightarrow matrix$

$Value \dot{/} Matrix1 \Rightarrow matrix$

$Matrix1 \dot{/} Matrix2$ returns a matrix that is the quotient of each pair of corresponding elements in $Matrix1$ and $Matrix2$.

$Value \dot{/} Matrix1$ returns a matrix that is the quotient of $Value$ and each element in $Matrix1$.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \dot{/} \begin{bmatrix} 10 & 20 \\ 30 & 40 \end{bmatrix} = \begin{bmatrix} \frac{1}{10} & \frac{1}{10} \\ \frac{1}{10} & \frac{1}{10} \end{bmatrix}$$

$$5 \dot{/} \begin{bmatrix} 10 & 20 \\ 30 & 40 \end{bmatrix} = \begin{bmatrix} \frac{1}{2} & \frac{1}{4} \\ \frac{1}{6} & \frac{1}{8} \end{bmatrix}$$

.^ (dot power)
 **keys**

$Matrix1 \dot{\wedge} Matrix2 \Rightarrow matrix$

$Value \dot{\wedge} Matrix1 \Rightarrow matrix$

$Matrix1 \dot{\wedge} Matrix2$ returns a matrix where each element in $Matrix2$ is the exponent for the corresponding element in $Matrix1$.

$Value \dot{\wedge} Matrix1$ returns a matrix where each element in $Matrix1$ is the exponent for $Value$.

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \dot{\wedge} \begin{bmatrix} 0 & 2 \\ 3 & -1 \end{bmatrix} = \begin{bmatrix} 1 & 4 \\ 27 & \frac{1}{4} \end{bmatrix}$$

$$5 \dot{\wedge} \begin{bmatrix} 0 & 2 \\ 3 & -1 \end{bmatrix} = \begin{bmatrix} 1 & 25 \\ 125 & \frac{1}{5} \end{bmatrix}$$

= (equal)**= key** $Expr1 = Expr2 \Rightarrow$ Boolean expression $List1 = List2 \Rightarrow$ Boolean list $Matrix1 = Matrix2 \Rightarrow$ Boolean matrixReturns true if $Expr1$ is determined to be equal to $Expr2$.Returns false if $Expr1$ is determined to not be equal to $Expr2$.

Anything else returns a simplified form of the equation.

For lists and matrices, returns comparisons element by element.

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing $\boxed{\rightarrow}$ instead of $\boxed{\text{enter}}$ at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

Example function that uses math test symbols: $=, \neq, <, \leq, >, \geq$ Define $g(x) = \text{Func}$ If $x \leq 5$ Then

Return 5

ElseIf $x > 5$ and $x < 0$ ThenReturn $-x$ ElseIf $x \geq 0$ and $x \neq 10$ ThenReturn x ElseIf $x = 10$ Then

Return 3

EndIf

Returns the negation of an XOR Boolean operation on the two arguments. Returns true, false, or a simplified form of the equation.	$3 \Leftrightarrow 4$	-8
For lists and matrices, returns comparisons element by element.	$\{1, 2, 3\} \text{ xor } \{3, 2, 1\}$	$\{2, 0, 2\}$
Note: You can insert this operator from the keyboard by typing $\Leftrightarrow$	$\{1, 2, 3\} \Leftrightarrow \{3, 2, 1\}$	$\{-3, -1, -3\}$

! (factorial)

?|>
key

<i>Value1!</i> $\Rightarrow$ <i>value</i>	5!	120
<i>List1!</i> $\Rightarrow$ <i>list</i>		
<i>Matrix1!</i> $\Rightarrow$ <i>matrix</i>	$\{\{5, 4, 3\}\}!$	$\{120, 24, 6\}$
Returns the factorial of the argument.	$\begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}!$	$\begin{bmatrix} 1 & 2 \\ 6 & 24 \end{bmatrix}$
For a list or matrix, returns a list or matrix of factorials of the elements.		

& (append)

ctrl
⇐
keys

<i>String1</i> & <i>String2</i> $\Rightarrow$ <i>string</i>	"Hello " & "Nick"	"Hello Nick"
Returns a text string that is <i>String2</i> appended to <i>String1</i> .		

d() (derivative)

Catalog >

d (<i>Expr1</i> , <i>Var</i> [, <i>Order</i>]) <i>Var</i> = <i>Value</i> $\Rightarrow$ <i>value</i>	$\frac{d}{dx}(x) _{x=0}$	undef
d (<i>Expr1</i> , <i>Var</i> [, <i>Order</i>]) $\Rightarrow$ <i>value</i>		
d (<i>List1</i> , <i>Var</i> [, <i>Order</i>]) $\Rightarrow$ <i>list</i>		
d (<i>Matrix1</i> , <i>Var</i> [, <i>Order</i>]) $\Rightarrow$ <i>matrix</i>	$x:=0: \frac{d}{dx}(x)$	undef
Except when using the first syntax, you must store a numeric value in variable <i>Var</i> before evaluating d() . Refer to the examples.		
d() can be used for calculating first and second order derivative at a point numerically, using auto differentiation methods.	$x:=3: \frac{d}{dx}\left(\{x^2, x^3, x^4\}\right)$	$\{6, 27, 108\}$
<i>Order</i> , if included, must be 1 or 2 . The default is 1 .		
Note: You can insert this function from the keyboard by typing derivative (...) .		
Note: See also First derivative , page 5 or Second derivative , page 5.		
Note: The d() algorithm has a limitation: it works recursively through the unsimplified expression, computing the numeric value of the first derivative (and second, if applicable) and the evaluation of each subexpression, which may lead to an unexpected result.	$\frac{d}{dx}\left(x \cdot \left(x^2 + x\right)^{\frac{1}{3}}\right) _{x=0}$	undef
Consider the example on the right. The first derivative of $x \cdot (x^2 + x)^{1/3}$ at $x=0$ is equal to 0. However, because the first derivative of the subexpression $(x^2 + x)^{1/3}$ is undefined at $x=0$, and this value is used to calculate the derivative of the total expression, d() reports the result as undefined and displays a warning message.	centralDiff $\left(x \cdot \left(x^2 + x\right)^{\frac{1}{3}}, x\right) _{x=0}$	0.000033
If you encounter this limitation, verify the solution graphically. You can also try using centralDiff() .		

$\int()$ (integral)

Catalog > 

$\int(\text{Expr1}, \text{Var}, \text{Lower}, \text{Upper}) \Rightarrow \text{value}$

Returns the integral of *Expr1* with respect to the variable *Var* from *Lower* to *Upper*. Can be used to calculate the definite integral numerically, using the same method as `nInt()`.

Note: You can insert this function from the keyboard by typing `integral(...)`.

Note: See also `nInt()`, page 68, and **Definite integral template**, page 5.

$$\int_0^1 x^2 dx = 0.333333$$

$\sqrt{()}$ (square root)

  **keys**

$\sqrt{\text{Value1}} \Rightarrow \text{value}$

$\sqrt{\text{List1}} \Rightarrow \text{list}$

Returns the square root of the argument.

For a list, returns the square roots of all the elements in *List1*.

Note: You can insert this function from the keyboard by typing `sqrt(...)`

Note: See also **Square root template**, page 1.

$$\sqrt{4} = 2$$

$$\sqrt{\{9, 2, 4\}} = \{3, 1.41421, 2\}$$

$\prod()$ (prodSeq)

Catalog > 

$\prod(\text{Expr1}, \text{Var}, \text{Low}, \text{High}) \Rightarrow \text{expression}$

Note: You can insert this function from the keyboard by typing `prodSeq(...)`.

Evaluates *Expr1* for each value of *Var* from *Low* to *High*, and returns the product of the results.

Note: See also **Product template** ($\prod$), page 4.

$$\prod_{n=1}^5 \left(\frac{1}{n} \right) = \frac{1}{120}$$

$$\prod_{n=1}^5 \left(\left\{ \frac{1}{n}, n, 2 \right\} \right) = \left\{ \frac{1}{120}, 120, 32 \right\}$$

$\prod(\text{Expr1}, \text{Var}, \text{Low}, \text{Low}-1) \Rightarrow 1$

$\prod(\text{Expr1}, \text{Var}, \text{Low}, \text{High})$

$\Rightarrow 1 \prod(\text{Expr1}, \text{Var}, \text{High}+1, \text{Low}-1)$ if $\text{High} < \text{Low}-1$

$$\prod_{k=4}^3 (k) = 1$$

The product formulas used are derived from the following reference:

Ronald L. Graham, Donald E. Knuth, and Oren Patashnik. *Concrete Mathematics: A Foundation for Computer Science*. Reading, Massachusetts: Addison-Wesley, 1994.

$$\prod_{k=4}^1 \left(\frac{1}{k} \right) = 6$$

$$\prod_{k=4}^1 \left(\frac{1}{k} \right) \cdot \prod_{k=2}^4 \left(\frac{1}{k} \right) = \frac{1}{4}$$

$\Sigma()$ (sumSeq)Catalog >  $\Sigma(\text{Expr1}, \text{Var}, \text{Low}, \text{High}) \Rightarrow \text{expression}$ **Note:** You can insert this function from the keyboard by typing **sumSeq (...)**.Evaluates *Expr1* for each value of *Var* from *Low* to *High*, and returns the sum of the results.**Note:** See also **Sum template**, page 4. $\Sigma(\text{Expr1}, \text{Var}, \text{Low}, \text{Low}-1) \Rightarrow 0$ $\Sigma(\text{Expr1}, \text{Var}, \text{Low}, \text{High})$ $\Rightarrow -\Sigma(\text{Expr1}, \text{Var}, \text{High}+1, \text{Low}-1)$ if $\text{High} < \text{Low}-1$

The summation formulas used are derived from the following reference:

Ronald L. Graham, Donald E. Knuth, and Oren Patashnik. *Concrete Mathematics: A Foundation for Computer Science*. Reading, Massachusetts: Addison-Wesley, 1994.

$$\sum_{n=1}^5 \left(\frac{1}{n} \right) = \frac{137}{60}$$

$$\sum_{k=4}^3 (k) = 0$$

$$\sum_{k=4}^1 (k) = -5$$

$$\sum_{k=4}^1 (k) + \sum_{k=2}^4 (k) = 4$$

 $\Sigma\text{Int}()$ Catalog >  $\Sigma\text{Int}(\text{NPmt1}, \text{NPmt2}, N, I, \text{PV}, [\text{Pmt}], [\text{FV}], [\text{PpY}], [\text{CpY}], [\text{PmtAt}], [\text{roundValue}]) \Rightarrow \text{value}$ $\Sigma\text{Int}(\text{NPmt1}, \text{NPmt2}, \text{amortTable}) \Rightarrow \text{value}$

Amortization function that calculates the sum of the interest during a specified range of payments.

NPmt1 and *NPmt2* define the start and end boundaries of the payment range.*N*, *I*, *PV*, *Pmt*, *FV*, *PpY*, *CpY*, and *PmtAt* are described in the table of TVM arguments, page 108.

- If you omit *Pmt*, it defaults to $\text{Pmt}=\text{tvmPmt}(N, I, \text{PV}, \text{FV}, \text{PpY}, \text{CpY}, \text{PmtAt})$.
- If you omit *FV*, it defaults to *FV*=0.
- The defaults for *PpY*, *CpY*, and *PmtAt* are the same as for the TVM functions.

roundValue specifies the number of decimal places for rounding. Default=2. $\Sigma\text{Int}(\text{NPmt1}, \text{NPmt2}, \text{amortTable})$ calculates the sum of the interest based on amortization table *amortTable*. The *amortTable* argument must be a matrix in the form described under **amortTbl()**, page 6.**Note:** See also **$\Sigma\text{Prn}()$** , below, and **Bal()**, page 12.

$$\Sigma\text{Int}(1, 3, 12, 4.75, 20000, 12, 12) = -213.48$$

ΣPrn()Catalog > 

$\Sigma\text{Prn}(\text{NPmt1}, \text{NPmt2}, N, I, \text{PV}, [\text{Pmt}], [\text{FV}], [\text{PpY}], [\text{CpY}], [\text{PmtAt}], [\text{roundValue}]) \Rightarrow \text{value}$

$\Sigma\text{Prn}(\text{NPmt1}, \text{NPmt2}, \text{amortTable}) \Rightarrow \text{value}$

Amortization function that calculates the sum of the principal during a specified range of payments.

NPmt1 and *NPmt2* define the start and end boundaries of the payment range.

N, *I*, *PV*, *Pmt*, *FV*, *PpY*, *CpY*, and *PmtAt* are described in the table of TVM arguments, page 108.

- If you omit *Pmt*, it defaults to $\text{Pmt}=\text{tvmPmt}(N, I, \text{PV}, \text{FV}, \text{PpY}, \text{CpY}, \text{PmtAt})$.
- If you omit *FV*, it defaults to $\text{FV}=0$.
- The defaults for *PpY*, *CpY*, and *PmtAt* are the same as for the TVM functions.

roundValue specifies the number of decimal places for rounding. Default=2.

$\Sigma\text{Prn}(\text{NPmt1}, \text{NPmt2}, \text{amortTable})$ calculates the sum of the principal paid based on amortization table *amortTable*. The *amortTable* argument must be a matrix in the form described under **amortTbl()**, page 6.

Note: See also **ΣInt()**, above, and **Bal()**, page 12.

$\Sigma\text{Prn}(1, 3, \text{tbl}) \rightarrow -4916.28$

(indirection)ctrl  **keys**

varNameString

Refers to the variable whose name is *varNameString*. This lets you use strings to create variable names from within a function.

$\text{xyz}:=12 \quad 12$

$\#("x" \& "y" \& "z") \quad 12$

Creates or refers to the variable xyz.

$10 \rightarrow r \quad 10$

$"r" \rightarrow sI \quad "r"$

$\#sI \quad 10$

Returns the value of the variable (r) whose name is stored in variable s1.

E (scientific notation) **key**

*mantissa*E*exponent*

Enters a number in scientific notation. The number is interpreted as *mantissa* × 10^{*exponent*}.

Hint: If you want to enter a power of 10 without causing a decimal value result, use 10^{^integer}.

Note: You can insert this operator from the computer keyboard by typing @E. for example, type 2.3@E4 to enter 2.3E4.

23000. 23000.

2300000000.+4.1E15 4.1E15

3.10⁴ 30000

° (gadian)

key

$\text{Expr1}^\circ \Rightarrow \text{expression}$

$\text{List1}^\circ \Rightarrow \text{list}$

$\text{Matrix1}^\circ \Rightarrow \text{matrix}$

This function gives you a way to specify a gadian angle while in the Degree or Radian mode.

In Radian angle mode, multiplies Expr1 by $\pi/200$.

In Degree angle mode, multiplies Expr1 by $g/100$.

In Gradian mode, returns Expr1 unchanged.

Note: You can insert this symbol from the computer keyboard by typing @g.

In Degree, Gradian or Radian mode:

$\cos(50^\circ)$	0.707107
$\cos(\{0, 100^\circ, 200^\circ\})$	$\{1., 0., -1.\}$

ʳ (radian)

key

$\text{Value1}^r \Rightarrow \text{value}$

$\text{List1}^r \Rightarrow \text{list}$

$\text{Matrix1}^r \Rightarrow \text{matrix}$

This function gives you a way to specify a radian angle while in Degree or Gradian mode.

In Degree angle mode, multiplies the argument by $180/\pi$.

In Radian angle mode, returns the argument unchanged.

In Gradian mode, multiplies the argument by $200/\pi$.

Hint: Use r if you want to force radians in a function definition regardless of the mode that prevails when the function is used.

Note: You can insert this symbol from the computer keyboard by typing @r.

In Degree, Gradian or Radian angle mode:

$\cos\left(\frac{\pi}{4}^r\right)$	0.707107
$\cos\left(\left\{0^r, \left(\frac{\pi}{12}\right)^r, (\pi)^r\right\}\right)$	$\{1., 0.965926, -1.\}$

° (degree)

key

$\text{Value1}^\circ \Rightarrow \text{value}$

$\text{List1}^\circ \Rightarrow \text{list}$

$\text{Matrix1}^\circ \Rightarrow \text{matrix}$

This function gives you a way to specify a degree angle while in Gradian or Radian mode.

In Radian angle mode, multiplies the argument by $\pi/180$.

In Degree angle mode, returns the argument unchanged.

In Gradian angle mode, multiplies the argument by $10/9$.

Note: You can insert this symbol from the computer keyboard by typing @d.

In Degree, Gradian or Radian angle mode:

$\cos(45^\circ)$	0.707107
In Radian angle mode:	
$\cos\left(\left\{0, \frac{\pi}{4}, 90^\circ, 30.12^\circ\right\}\right)$	$\{1., 0.707107, 0., 0.864976\}$

°, ', '' (degree/minute/second)

keys

$dd^\circ mm' ss.ss'' \Rightarrow \text{expression}$

dd A positive or negative number

mm A non-negative number

$ss.ss$ A non-negative number

Returns $dd + (mm/60) + (ss.ss/3600)$.

This base-60 entry format lets you:

- Enter an angle in degrees/minutes/seconds without regard to the current angle mode.
- Enter time as hours/minutes/seconds.

Note: Follow $ss.ss$ with two apostrophes (''), not a quote symbol (").

In Degree angle mode:

$25^\circ 13' 17.5''$	25.2215
$25^\circ 30'$	$\frac{51}{2}$

∠ (angle)

ctrl  keys

[Radius, ∠θ_Angle] ⇒ vector
(polar input)

[Radius, ∠θ_Angle, Z_Coordinate] ⇒ vector
(cylindrical input)

[Radius, ∠θ_Angle, ∠θ_Angle] ⇒ vector
(spherical input)

Returns coordinates as a vector depending on the Vector Format mode setting: rectangular, cylindrical, or spherical.

Note: You can insert this symbol from the computer keyboard by typing @<.

In Radian mode and vector format set to:
rectangular

$$\begin{bmatrix} 5 & \angle 60^\circ & \angle 45^\circ \\ 1.76777 & 3.06186 & 3.53553 \end{bmatrix}$$

cylindrical

$$\begin{bmatrix} 5 & \angle 60^\circ & \angle 45^\circ \\ 3.53553 & \angle 1.0472 & 3.53553 \end{bmatrix}$$

spherical

$$\begin{bmatrix} 5 & \angle 60^\circ & \angle 45^\circ \\ 5. & \angle 1.0472 & \angle 0.785398 \end{bmatrix}$$

In Radian angle mode and Rectangular complex format:

$$5 + 3 \cdot i \cdot \left(10 \angle \frac{\pi}{4} \right) \quad -2.07107 - 4.07107 \cdot i$$

_ (underscore as an empty element)

See "Empty (Void) Elements", page 132.

10^()

Catalog > 

10^ (Value1) ⇒ value

10^ (List1) ⇒ list

Returns 10 raised to the power of the argument.

For a list, returns 10 raised to the power of the elements in List1.

10^ (squareMatrix1) ⇒ squareMatrix

Returns 10 raised to the power of squareMatrix1. This is not the same as calculating 10 raised to the power of each element. For information about the calculation method, refer to **cos()**.

squareMatrix1 must be diagonalizable. The result always contains floating-point numbers.

$$10^{1.5} \quad 31.6228$$

$$10^{\begin{bmatrix} 1 & 5 & 3 \\ 4 & 2 & 1 \\ 6 & -2 & 1 \end{bmatrix}} \quad \begin{bmatrix} 1.14336\text{E}7 & 8.17155\text{E}6 & 6.67589\text{E}6 \\ 9.95651\text{E}6 & 7.11587\text{E}6 & 5.81342\text{E}6 \\ 7.65298\text{E}6 & 5.46952\text{E}6 & 4.46845\text{E}6 \end{bmatrix}$$

^-1 (reciprocal)

Catalog > 

Value1 ^-1 ⇒ value

List1 ^-1 ⇒ list

Returns the reciprocal of the argument.

For a list, returns the reciprocals of the elements in List1.

squareMatrix1 ^-1 ⇒ squareMatrix

Returns the inverse of squareMatrix1.

squareMatrix1 must be a non-singular square matrix.

$$(3.1)^{-1} \quad 0.322581$$

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}^{-1} \quad \begin{bmatrix} -2 & 1 \\ 3 & -1 \\ 2 & 2 \end{bmatrix}$$

| (constraint operator)

ctrl  keys

Expr | BooleanExpr1 [and BooleanExpr2]...

Expr | BooleanExpr1 [or BooleanExpr2]...

The constraint ("|") symbol serves as a binary operator. The operand to the left of | is an expression. The operand to the right of | specifies one or more relations that are intended to affect the simplification of the expression. Multiple relations after | must be joined by logical "and" or "or" operators.

The constraint operator provides three basic types of functionality:

- Substitutions
- Interval constraints
- Exclusions

Substitutions are in the form of an equality, such as $x=3$ or $y=\sin(x)$. To be most effective, the left side should be a simple variable. Expr | Variable = value will substitute value for every occurrence of Variable in Expr.

Interval constraints take the form of one or more inequalities joined by logical "and" or "or" operators. Interval constraints also permit simplification that otherwise might be invalid or not computable.

$$x+1|x=3 \quad 4$$

$$x+55|x=\sin(55) \quad 54.0002$$

$$x^3-2\cdot x+7 \rightarrow f(x) \quad Done$$

$$f(x)|x=\sqrt{3} \quad 8.73205$$

$$\text{nSolve}(x^3+2\cdot x^2-15\cdot x=0,x) \quad 0.$$

$$\text{nSolve}(x^3+2\cdot x^2-15\cdot x=0,x)|x>0 \text{ and } x<5 \quad 3.$$

Exclusions use the "not equals" ($\neq$ or $\neq$) relational operator to exclude a specific value from consideration.

→ (store)

ctrl  key

Value → Var

List → Var

Matrix → Var

Expr → Function(Param1,...)

List → Function(Param1,...)

Matrix → Function(Param1,...)

If the variable Var does not exist, creates it and initializes it to Value, List, or Matrix.

If the variable Var already exists and is not locked or protected, replaces its contents with Value, List, or Matrix.

Note: You can insert this operator from the keyboard by typing =: as a shortcut. For example, type $\pi/4 =: \text{myvar}$.

$$\frac{\pi}{4} \rightarrow \text{myvar} \quad 0.785398$$

$$2\cdot \cos(x) \rightarrow yI(x) \quad Done$$

$$\{1,2,3,4\} \rightarrow \text{lst5} \quad \{1,2,3,4\}$$

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix} \rightarrow \text{matg} \quad \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$$

$$\text{"Hello"} \rightarrow \text{str1} \quad \text{"Hello"}$$

:= (assign)ctrl  **keys**

Var := Value
 Var := List
 Var := Matrix
 Function(Param1,...) := Expr
 Function(Param1,...) := List
 Function(Param1,...) := Matrix

If variable Var does not exist, creates Var and initializes it to Value, List, or Matrix.

If Var already exists and is not locked or protected, replaces its contents with Value, List, or Matrix.

$myvar := \frac{\pi}{4}$	.785398
--------------------------	---------

$y1(x) := 2 \cdot \cos(x)$	Done
----------------------------	------

$lst5 := \{1, 2, 3, 4\}$	$\{1, 2, 3, 4\}$
--------------------------	------------------

$matg := \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$	$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$
--	--

$str1 := \text{"Hello"}$	"Hello"
--------------------------	---------

Ⓒ (comment)ctrl  **keys**

Ⓒ [text]

Ⓒ processes text as a comment line, allowing you to annotate functions and programs that you create.

Ⓒ can be at the beginning or anywhere in the line. Everything to the right of Ⓒ, to the end of the line, is the comment.

Note for entering the example: In the Calculator application on the handheld, you can enter multi-line definitions by pressing 

instead of  at the end of each line. On the computer keyboard, hold down **Alt** and press **Enter**.

Define $g(n) = \text{Func}$

Ⓒ Declare variables

Local $i, result$

result:=0

For $i, 1, n, 1$ Ⓒ Loop n times

result:=result+ i^2

EndFor

Return result

EndFunc

Done

$g(3)$	14
--------	----

0b, 0h0 **B** keys, 0 **H** keys

0b binaryNumber

0h hexadecimalNumber

Denotes a binary or hexadecimal number, respectively. To enter a binary or hex number, you must enter the 0b or 0h prefix regardless of the Base mode. Without a prefix, a number is treated as decimal (base 10).

Results are displayed according to the Base mode.

In Dec base mode:

0b10+0hF+10	27
-------------	----

In Bin base mode:

0b10+0hF+10	0b11011
-------------	---------

In Hex base mode:

0b10+0hF+10	0h1B
-------------	------

Empty (Void) Elements

When analyzing real-world data, you might not always have a complete data set. TI-Nspire™ Software allows empty, or void, data elements so you can proceed with the nearly complete data rather than having to start over or discard the incomplete cases.

You can find an example of data involving empty elements in the Lists & Spreadsheet chapter, under "Graphing spreadsheet data."

The **delVoid()** function lets you remove empty elements from a list. The **isVoid()** function lets you test for an empty element. For details, see **delVoid()**, page 29, and **isVoid()**, page 49.

Note: To enter an empty element manually in a math expression, type " _ " or the keyword **void**. The keyword **void** is automatically converted to a " _ " symbol when the expression is evaluated. To type " _ " on the handheld, press  .

Calculations involving void elements

The majority of calculations involving a void input will produce a void result. See special cases below.

$_$	$_$
$\gcd(100, _)$	$_$
$3 + _$	$_$
$\{5, _, 10\} - \{3, 6, 9\}$	$\{2, _, 1\}$

List arguments containing void elements

The following functions and commands ignore (skip) void elements found in list arguments.

count, **countIf**, **cumulativeSum**, **freqTable**, **list**, **frequency**, **max**, **mean**, **median**, **product**, **stDevPop**, **stDevSamp**, **sum**, **sumIf**, **varPop**, and **varSamp**, as well as regression calculations, **OneVar**, **TwoVar**, and **FiveNumSummary** statistics, confidence intervals, and stat tests

$\text{sum}\{\{2, _, 3, 5, 6, 6\}\}$	16.6
$\text{median}\{\{1, 2, _, _, 3\}\}$	2
$\text{cumulativeSum}\{\{1, 2, _, 4, 5\}\}$	$\{1, 3, _, 7, 12\}$
$\text{cumulativeSum}\left(\begin{bmatrix} 1 & 2 \\ 3 & _ \\ 5 & 6 \end{bmatrix}\right)$	$\begin{bmatrix} 1 & 2 \\ 4 & _ \\ 9 & 8 \end{bmatrix}$

SortA and **SortD** move all void elements within the first argument to the bottom.

$\{5, 4, 3, _, 1\} \rightarrow \text{list1}$	$\{5, 4, 3, _, 1\}$
$\{5, 4, 3, 2, 1\} \rightarrow \text{list2}$	$\{5, 4, 3, 2, 1\}$
$\text{SortA list1, list2}$	Done
list1	$\{1, 3, 4, 5, _ \}$
list2	$\{1, 3, 4, 5, 2\}$
$\{1, 2, 3, _, 5\} \rightarrow \text{list1}$	$\{1, 2, 3, _, 5\}$
$\{1, 2, 3, 4, 5\} \rightarrow \text{list2}$	$\{1, 2, 3, 4, 5\}$
$\text{SortD list1, list2}$	Done
list1	$\{5, 3, 2, 1, _ \}$
list2	$\{5, 3, 2, 1, 4\}$

List arguments containing void elements(continued)

In regressions, a void in an X or Y list introduces a void for the corresponding element of the residual.

$II := \{1, 2, 3, 4, 5\}; I2 := \{2, _, 3, 5, 6, 6\}$	$\{2, _, 3, 5, 6, 6\}$
LinRegMx $II, I2$	Done
stat.Resid	$\{0.434286, _, -0.862857, -0.011429, 0.44\}$
stat.XReg	$\{1, _, 3, 4, 5, \}$
stat.YReg	$\{2, _, 3, 5, 6, 6\}$
stat.FreqReg	$\{1, _, 1, 1, 1, \}$

An omitted category in regressions introduces a void for the corresponding element of the residual.

$II := \{1, 3, 4, 5\}; I2 := \{2, 3, 5, 6, 6\}$	$\{2, 3, 5, 6, 6\}$
cat: = { "M", "M", "F", "F" }; incl: = { "F" }	{ "F" }
LinRegMx $II, I2, 1, cat, incl$	Done
stat.Resid	$\{ _, _, 0, 0, \}$
stat.XReg	$\{ _, _, 4, 5, \}$
stat.YReg	$\{ _, _, 5, 6, 6\}$
stat.FreqReg	$\{ _, _, 1, 1, 1, \}$

A frequency of 0 in regressions introduces a void for the corresponding element of the residual.

$II := \{1, 3, 4, 5\}; I2 := \{2, 3, 5, 6, 6\}$	$\{2, 3, 5, 6, 6\}$
LinRegMx $II, I2, \{1, 0, 1, 1\}$	Done
stat.Resid	$\{0.069231, _, -0.276923, 0.207692\}$
stat.XReg	$\{1, _, 4, 5, \}$
stat.YReg	$\{2, _, 5, 6, 6\}$
stat.FreqReg	$\{1, _, 1, 1, 1, \}$

Shortcuts for Entering Math Expressions

Shortcuts let you enter elements of math expressions by typing instead of using the Catalog or Symbol Palette. For example, to enter the expression $\sqrt{6}$, you can type `sqrt(6)` on the entry line. When you press `enter`, the expression `sqrt(6)` is changed to $\sqrt{6}$. Some shortcuts are useful from both the handheld and the computer keyboard. Others are useful primarily from the computer keyboard.

From the Handheld or Computer Keyboard

To enter this:	Type this shortcut:
π	<code>pi</code>
θ	<code>theta</code>
∞	<code>infinity</code>
$\leq$	<code><=</code>
$\geq$	<code>>=</code>
$\neq$	<code>/=</code>
$\Rightarrow$ (logical implication)	<code>=></code>
$\Leftrightarrow$ (logical double implication, XNOR)	<code><=></code>
$\rightarrow$ (store operator)	<code>=:</code>
$ $ (absolute value)	<code>abs(...)</code>
$\sqrt{}$	<code>sqrt(...)</code>
$\Sigma()$ (Sum template)	<code>sumSeq(...)</code>
$\Pi()$ (Product template)	<code>prodSeq(...)</code>
$\sin^{-1}()$, $\cos^{-1}()$, ...	<code>arcsin(...)</code> , <code>arccos(...)</code> , ...
$\Delta\text{List}()$	<code>deltaList(...)</code>

From the Computer Keyboard

To enter this:	Type this shortcut:
i (imaginary constant)	<code>@i</code>
e (natural log base e)	<code>@e</code>
E (scientific notation)	<code>@E</code>
T (transpose)	<code>@t</code>
r (radians)	<code>@r</code>
$^\circ$ (degrees)	<code>@d</code>

To enter this:	Type this shortcut:
g (gradians)	@g
$\angle$ (angle)	@<
$\blacktriangleright$ (conversion)	@>
$\blacktriangleright$ Decimal, $\blacktriangleright$ approxFraction(), and so on.	@>Decimal, @>approxFraction(), and so on.

EOS™ (Equation Operating System) Hierarchy

This section describes the Equation Operating System (EOS™) that is used by the TI-Nspire™ math and science learning technology. Numbers, variables, and functions are entered in a simple, straightforward sequence. EOS™ software evaluates expressions and equations using parenthetical grouping and according to the priorities described below.

Order of Evaluation

Level	Operator
1	Parentheses (), brackets [], braces { }
2	Indirection (#)
3	Function calls
4	Post operators: degrees-minutes-seconds ([°] , ', "), factorial (!), percentage (%), radian (^r), subscript ([]), transpose (^T)
5	Exponentiation, power operator (^)
6	Negation (-)
7	String concatenation (&)
8	Multiplication (*), division (/)
9	Addition (+), subtraction (-)
10	Equality relations: equal (=), not equal (≠ or /=), less than (<), less than or equal (≤ or <=), greater than (>), greater than or equal (≥ or >=)
11	Logical not
12	Logical and
13	Logical or
14	xor, nor, nand
15	Logical implication (⇒)
16	Logical double implication, XNOR (⇔)
17	Constraint operator (" ")
18	Store (→)

Parentheses, Brackets, and Braces

All calculations inside a pair of parentheses, brackets, or braces are evaluated first. For example, in the expression $4(1+2)$, EOS™ software first evaluates the portion of the expression inside the parentheses, $1+2$, and then multiplies the result, 3, by 4.

The number of opening and closing parentheses, brackets, and braces must be the same within an expression or equation. If not, an error message is displayed that indicates the missing element. For example, $(1+2)/(3+4$ will display the error message "Missing)."

Note: Because the TI-Nspire™ software allows you to define your own functions, a variable name followed by an expression in parentheses is considered a “function call” instead of implied multiplication. For example $a(b+c)$ is the function a evaluated by $b+c$. To multiply the expression $b+c$ by the variable a , use explicit multiplication: $a*(b+c)$.

Indirection

The indirection operator (#) converts a string to a variable or function name. For example, $\#("x"&"y"&"z")$ creates the variable name xyz . Indirection also allows the creation and modification of variables from inside a program. For example, if $10 \rightarrow r$ and $"r" \rightarrow s1$, then $\#s1 = 10$.

Post Operators

Post operators are operators that come directly after an argument, such as $5!$, 25% , or $60^\circ 15' 45''$. Arguments followed by a post operator are evaluated at the fourth priority level. For example, in the expression $4^3!$, $3!$ is evaluated first. The result, 6, then becomes the exponent of 4 to yield 4096.

Exponentiation

Exponentiation (^) and element-by-element exponentiation (.^) are evaluated from right to left. For example, the expression 2^3^2 is evaluated the same as $2^{(3^2)}$ to produce 512. This is different from $(2^3)^2$, which is 64.

Negation

To enter a negative number, press $\boxed{-}$ followed by the number. Post operations and exponentiation are performed before negation. For example, the result of $-x^2$ is a negative number, and $-9^2 = -81$. Use parentheses to square a negative number such as $(-9)^2$ to produce 81.

Constraint ("|")

The argument following the constraint ("|") operator provides a set of constraints that affect the evaluation of the argument preceding the operator.

Error Codes and Messages

When an error occurs, its code is assigned to variable *errCode*. User-defined programs and functions can examine *errCode* to determine the cause of an error. For an example of using *errCode*, See Example 2 under the **Try** command, page [106](#).

Note: Some error conditions apply only to TI-Nspire™ CAS products, and some apply only to TI-Nspire™ products.

Error code	Description
10	A function did not return a value
20	A test did not resolve to TRUE or FALSE. Generally, undefined variables cannot be compared. For example, the test $If\ a < b$ will cause this error if either <i>a</i> or <i>b</i> is undefined when the <i>If</i> statement is executed.
30	Argument cannot be a folder name.
40	Argument error
50	Argument mismatch Two or more arguments must be of the same type.
60	Argument must be a Boolean expression or integer
70	Argument must be a decimal number
90	Argument must be a list
100	Argument must be a matrix
130	Argument must be a string
140	Argument must be a variable name. Make sure that the name: • does not begin with a digit • does not contain spaces or special characters • does not use underscore or period in invalid manner • does not exceed the length limitations See the Calculator section in the documentation for more details.
160	Argument must be an expression
165	Batteries too low for sending or receiving Install new batteries before sending or receiving.
170	Bound The lower bound must be less than the upper bound to define the search interval.
180	Break The  or  key was pressed during a long calculation or during program execution.
190	Circular definition This message is displayed to avoid running out of memory during infinite replacement of variable values during simplification. For example, $a+1 \rightarrow a$, where <i>a</i> is an undefined variable, will cause this error.
200	Constraint expression invalid For example, $solve(3x^2-4=0,x) \mid x < 0 \text{ or } x > 5$ would produce this error message because the constraint is separated by "or" instead of "and."
210	Invalid Data type An argument is of the wrong data type.
220	Dependent limit

Error code	Description
230	Dimension A list or matrix index is not valid. For example, if the list {1,2,3,4} is stored in L1, then L1[5] is a dimension error because L1 only contains four elements.
235	Dimension Error. Not enough elements in the lists.
240	Dimension mismatch Two or more arguments must be of the same dimension. For example, [1,2]+[1,2,3] is a dimension mismatch because the matrices contain a different number of elements.
250	Divide by zero
260	Domain error An argument must be in a specified domain. For example, rand(0) is not valid.
270	Duplicate variable name
280	Else and Elseif invalid outside of If...EndIf block
290	EndTry is missing the matching Else statement
295	Excessive iteration
300	Expected 2 or 3-element list or matrix
310	The first argument of nSolve must be an equation in a single variable. It cannot contain a non-valued variable other than the variable of interest.
320	First argument of solve or cSolve must be an equation or inequality For example, solve(3x^2-4,x) is invalid because the first argument is not an equation.
345	Inconsistent units
350	Index out of range
360	Indirection string is not a valid variable name
380	Undefined Ans Either the previous calculation did not create Ans, or no previous calculation was entered.
390	Invalid assignment
400	Invalid assignment value
410	Invalid command
430	Invalid for the current mode settings
435	Invalid guess
440	Invalid implied multiply For example, x(x+1) is invalid; whereas, x*(x+1) is the correct syntax. This is to avoid confusion between implied multiplication and function calls.
450	Invalid in a function or current expression Only certain commands are valid in a user-defined function.
490	Invalid in Try..EndTry block
510	Invalid list or matrix
550	Invalid outside function or program A number of commands are not valid outside a function or program. For example, Local cannot be used unless it is in a function or program.
560	Invalid outside Loop..EndLoop, For..EndFor, or While..EndWhile blocks For example, the Exit command is valid only inside these loop blocks.
565	Invalid outside program

Error code	Description
570	Invalid pathname For example, \var is invalid.
575	Invalid polar complex
580	Invalid program reference Programs cannot be referenced within functions or expressions such as 1+p(x) where p is a program.
600	Invalid table
605	Invalid use of units
610	Invalid variable name in a Local statement
620	Invalid variable or function name
630	Invalid variable reference
640	Invalid vector syntax
650	Link transmission A transmission between two units was not completed. Verify that the connecting cable is connected firmly to both ends.
665	Matrix not diagonalizable
670	Low Memory 1. Delete some data in this document 2. Save and close this document If 1 and 2 fail, pull out and re-insert batteries
672	Resource exhaustion
673	Resource exhaustion
680	Missing (
690	Missing)
700	Missing "
710	Missing]
720	Missing }
730	Missing start or end of block syntax
740	Missing Then in the If..EndIf block
750	Name is not a function or program
765	No functions selected
780	No solution found
800	Non-real result For example, if the software is in the Real setting, $\sqrt{-1}$ is invalid. To allow complex results, change the "Real or Complex" Mode Setting to RECTANGULAR or POLAR.
830	Overflow
850	Program not found A program reference inside another program could not be found in the provided path during execution.
855	Rand type functions not allowed in graphing
860	Recursion too deep

Error code	Description
870	Reserved name or system variable
900	Argument error Median-median model could not be applied to data set.
910	Syntax error
920	Text not found
930	Too few arguments The function or command is missing one or more arguments.
940	Too many arguments The expression or equation contains an excessive number of arguments and cannot be evaluated.
950	Too many subscripts
955	Too many undefined variables
960	Variable is not defined No value is assigned to variable. Use one of the following commands: • sto → • := • Define to assign values to variables.
965	Unlicensed OS
970	Variable in use so references or changes are not allowed
980	Variable is protected
990	Invalid variable name Make sure that the name does not exceed the length limitations
1000	Window variables domain
1010	Zoom
1020	Internal error
1030	Protected memory violation
1040	Unsupported function. This function requires Computer Algebra System. Try TI-Nspire™ CAS.
1045	Unsupported operator. This operator requires Computer Algebra System. Try TI-Nspire™ CAS.
1050	Unsupported feature. This operator requires Computer Algebra System. Try TI-Nspire™ CAS.
1060	Input argument must be numeric. Only inputs containing numeric values are allowed.
1070	Trig function argument too big for accurate reduction
1080	Unsupported use of Ans. This application does not support Ans.
1090	Function is not defined. Use one of the following commands: • Define • := • sto → to define a function.
1100	Non-real calculation For example, if the software is in the Real setting, $\sqrt{(-1)}$ is invalid. To allow complex results, change the "Real or Complex" Mode Setting to RECTANGULAR or POLAR.
1110	Invalid bounds
1120	No sign change

Error code	Description
1130	Argument cannot be a list or matrix
1140	Argument error The first argument must be a polynomial expression in the second argument. If the second argument is omitted, the software attempts to select a default.
1150	Argument error The first two arguments must be polynomial expressions in the third argument. If the third argument is omitted, the software attempts to select a default.
1160	Invalid library pathname A pathname must be in the form xxx\yyy, where: - The xxx part can have 1 to 16 characters. - The yyy part can have 1 to 15 characters. See the Library section in the documentation for more details.
1170	Invalid use of library pathname - A value cannot be assigned to a pathname using Define, :=, or sto →. - A pathname cannot be declared as a Local variable or be used as a parameter in a function or program definition.
1180	Invalid library variable name. Make sure that the name: - Does not contain a period - Does not begin with an underscore - Does not exceed 15 characters See the Library section in the documentation for more details.
1190	Library document not found: - Verify library is in the MyLib folder. - Refresh Libraries. See the Library section in the documentation for more details.
1200	Library variable not found: - Verify library variable exists in the first problem in the library. - Make sure library variable has been defined as LibPub or LibPriv. - Refresh Libraries. See the Library section in the documentation for more details.
1210	Invalid library shortcut name. Make sure that the name: - Does not contain a period - Does not begin with an underscore - Does not exceed 16 characters - Is not a reserved name See the Library section in the documentation for more details.
1220	Domain error: The tangentLine and normalline functions support real-valued functions only.
1230	Domain error. Trigonometric conversion operators are not supported in Degree or Radian angle modes.
1250	Argument Error Use a system of linear equations. Example of a system of two linear equations with variables x and y: $3x + 7y = 5$ $2y - 5x = -1$
1260	Argument Error: The first argument of nfMin or nfMax must be an expression in a single variable. It cannot contain a non-valued variable other than the variable of interest.
1270	Argument Error Order of the derivative must be equal to 1 or 2.
1280	Argument Error Use a polynomial in expanded form in one variable.

Error code	Description
1290	Argument Error Use a polynomial in one variable.
1300	Argument Error The coefficients of the polynomial must evaluate to numeric values.
1310	Argument error: A function could not be evaluated for one or more of its arguments.
1380	Argument error: Nested calls to domain() function are not allowed.

Warning Codes and Messages

You can use the **warnCodes()** function to store the codes of warnings generated by evaluating an expression. This table lists each numeric warning code and its associated message. For an example of storing warning codes, see **warnCodes()**, page [111](#).

Warning code	Message
10000	Operation might introduce false solutions.
10001	Differentiating an equation may produce a false equation.
10002	Questionable solution
10003	Questionable accuracy
10004	Operation might lose solutions.
10005	cSolve might specify more zeros.
10006	Solve may specify more zeros.
10007	More solutions may exist. Try specifying appropriate lower and upper bounds and/or a guess. Examples using solve(): • <code>solve(Equation, Var=Guess) lowBound<Var<upBound</code> • <code>solve(Equation, Var) lowBound<Var<upBound</code> • <code>solve(Equation, Var=Guess)</code>
10008	Domain of the result might be smaller than the domain of the input.
10009	Domain of the result might be larger than the domain of the input.
10012	Non-real calculation
10013	∞^0 or undef^0 replaced by 1
10014	undef^0 replaced by 1
10015	1^∞ or 1^{undef} replaced by 1
10016	1^{undef} replaced by 1
10017	Overflow replaced by ∞ or $-\infty$
10018	Operation requires and returns 64 bit value.
10019	Resource exhaustion, simplification might be incomplete.
10020	Trig function argument too big for accurate reduction.
10021	Input contains an undefined parameter. Result might not be valid for all possible parameter values.
10022	Specifying appropriate lower and upper bounds might produce a solution.
10023	Scalar has been multiplied by the identity matrix.
10024	Result obtained using approximate arithmetic.
10025	Equivalence cannot be verified in EXACT mode.
10026	Constraint might be ignored. Specify constraint in the form " <code>\</code> " 'Variable MathTestSymbol Constant' or a conjunct of these forms, for example ' <code>x<3</code> and <code>x>-12</code> '

Service and Support

Texas Instruments Support and Service

For U.S. and Canada:

For General Information

Home Page: education.ti.com

KnowledgeBase and e-mail inquiries: education.ti.com/support

Phone: (800) TI-CARES / (800) 842-2737
For U.S., Canada, Mexico, Puerto Rico, and
Virgin Islands only

International information: education.ti.com/international

For Technical Support

KnowledgeBase and support by e-mail: education.ti.com/support

Phone (not toll-free): (972) 917-8324

For Product (Hardware) Service

Customers in the U.S., Canada, Mexico, Puerto Rico and Virgin Islands: Always contact Texas Instruments Customer Support before returning a product for service.

For All Other Countries:

For general information

For more information about TI products and services, contact TI by e-mail or visit the TI Internet address.

E-mail inquiries: ti-cares@ti.com
